What Is AWS Config?

AWS Config provides a detailed view of the configuration of AWS resources in your AWS account. This includes how the resources are related to one another and how they were configured in the past so that you can see how the configurations and relationships change over time.

An AWS *resource* is an entity you can work with in AWS, such as an Amazon Elastic Compute Cloud (EC2) instance, an Amazon Elastic Block Store (EBS) volume, a security group, or an Amazon Virtual Private Cloud (VPC). For a complete list of AWS resources supported by AWS Config, see Supported Resource Types for AWS Config.

Considerations

- **AWS account**: You need an active AWS account. For more information, see Signing up for AWS.
- **Amazon S3 Bucket**: You need an S3 bucket to receive data for your configuration snapshots and history. For more information, see Permissions for the Amazon S3 Bucket.
- **Amazon SNS Topic**: You need an Amazon SNS to receive notifications when there are changes to your configuration snapshots and history. For more information, see Permissions for the Amazon SNS Topic.
- **IAM Role**: You need an IAM role that has the necessary permissions to access AWS Config. For more information, see Permissions for the IAM Role.
- **Resource types**: You can decide which resource types you want AWS Config to record. For more information, see Recording AWS Resources.

Ways to Use AWS Config

When you run your applications on AWS, you usually use AWS resources, which you must create and manage collectively. As the demand for your application keeps growing, so does your need to keep track of your AWS resources. AWS Config is designed to help you oversee your application resources in the following scenarios:

Resource Administration

To exercise better governance over your resource configurations and to detect resource misconfigurations, you need fine-grained visibility into what resources exist and how these

resources are configured at any time. You can use AWS Config to notify you whenever resources are created, modified, or deleted without having to monitor these changes by polling the calls made to each resource.

You can use AWS Config rules to evaluate the configuration settings of your AWS resources. When AWS Config detects that a resource violates the conditions in one of your rules, AWS Config flags the resource as noncompliant and sends a notification. AWS Config continuously evaluates your resources as they are created, changed, or deleted.

Auditing and Compliance

You might be working with data that requires frequent audits to ensure compliance with internal policies and best practices. To demonstrate compliance, you need access to the historical configurations of your resources. This information is provided by AWS Config.

Managing and Troubleshooting Configuration Changes

When you use multiple AWS resources that depend on one another, a change in the configuration of one resource might have unintended consequences on related resources. With AWS Config, you can view how the resource you intend to modify is related to other resources and assess the impact of your change.

You can also use the historical configurations of your resources provided by AWS Config to troubleshoot issues and to access the last known good configuration of a problem resource.

Security Analysis

To analyze potential security weaknesses, you need detailed historical information about your AWS resource configurations, such as the AWS Identity and Access Management (IAM) permissions that are granted to your users, or the Amazon EC2 security group rules that control access to your resources.

You can use AWS Config to view the IAM policy that was assigned to a user, group, or role at any time in which AWS Config was recording. This information can help you determine the permissions that belonged to a user at a specific time: for example, you can view whether the user `John Doe` had permission to modify Amazon VPC settings on Jan 1, 2015.

You can also use AWS Config to view the configuration of your EC2 security groups, including the port rules that were open at a specific time. This information can help you determine whether a security group blocked incoming TCP traffic to a specific port.

Partner Solutions

AWS partners with third-party specialists in logging and analysis to provide solutions that use AWS Config output. For more information, visit the AWS Config detail page at AWS Config.

Features

When you set up AWS Config, you can complete the following:

Resource management

- Specify the resource types you want AWS Config to record.

- Set up an Amazon S3 bucket to receive a configuration snapshot on request and configuration history.
- Set up Amazon SNS to send configuration stream notifications.
- Grant AWS Config the permissions it needs to access the Amazon S3 bucket and the Amazon SNS topic.

  For more information, see Viewing AWS Resource Configurations and History and Managing AWS Resource Configurations and History.

Rules and conformance packs

- Specify the rules that you want AWS Config to use to evaluate compliance information for the recorded resource types.
- Use conformance packs, or a collection of rules that can be deployed and monitored as a single entity in your AWS account.

  For more information, see Evaluating Resources with AWS Config Rules and Conformance Packs.

Remediation

- Remediate noncompliant resources that are evaluated by AWS Config Rules.

  For more information, see Remediation.

Aggregators

- Use an aggregator to get a centralized view of your resource inventory and compliance. An aggregator collects AWS Config configuration and compliance data from multiple AWS accounts and AWS Regions into a single account and Region.

  For more information, see Multi-Account Multi-Region Data Aggregation.

Advanced queries

- Use one of the sample queries or write your own query by referring to the configuration schema of the AWS resource.

  For more information, see Querying the Current Configuration State of AWS Resources .

How AWS Config Works

AWS Config provides a detailed view of the configuration of AWS resources in your AWS account. This includes how the resources are related to one another and how they were configured in the past so that you can see how the configurations and relationships change over time.

An AWS *resource* is an entity you can work with in AWS, such as an Amazon Elastic Compute Cloud (EC2) instance, an Amazon Elastic Block Store (EBS) volume, a security group, or an Amazon Virtual Private Cloud (VPC). For a complete list of AWS resources supported by AWS Config, see Supported Resource Types for AWS Config.

Resource Discovery

When you turn on AWS Config, it first discovers the supported AWS resources that exist in your account and generates a configuration item for each resource.

AWS Config also generates configuration items when the configuration of a resource changes, and it maintains historical records of the configuration items of your resources from the time you start the configuration recorder. By default, AWS Config creates configuration items for every supported resource in the region. If you don't want AWS Config to create configuration items for all supported resources, you can specify the resource types that you want it to track.

Before specifying a resource type for AWS Config to track, check Resource Coverage by Region Availability to see if the resource type is supported in the AWS Region where you are setting up AWS Config. If a resource type is supported by AWS Config in at least one Region, you can enable the recording of that resource type in all Regions supported by AWS Config, even if the specified resource type is not supported the AWS Region where you are setting up AWS Config.

Resource Tracking

AWS Config keeps track of all changes to your resources by invoking the Describe or the List API call for each resource in your account. The service uses those same API calls to capture configuration details for all related resources.

For example, removing an egress rule from a VPC security group causes AWS Config to invoke a Describe API call on the security group. AWS Config then invokes a Describe API call on all of the instances associated with the security group. The updated configurations of the security group (the resource) and of each instance (the related resources) are recorded as configuration items and delivered in a configuration stream to an Amazon Simple Storage Service (Amazon S3) bucket.

AWS Config also tracks the configuration changes that were not initiated by the API. AWS Config examines the resource configurations periodically and generates configuration items for the configurations that have changed.

If you are using AWS Config rules, AWS Config continuously evaluates your AWS resource configurations for desired settings. Depending on the rule, AWS Config will evaluate your resources either in response to configuration changes or periodically. Each rule is associated with an AWS Lambda function, which contains the evaluation logic for the rule. When AWS Config evaluates your resources, it invokes the rule's AWS Lambda function. The function returns the compliance status of the evaluated resources. If a resource violates the conditions of a rule, AWS Config flags

the resource and the rule as noncompliant. When the compliance status of a resource changes, AWS Config sends a notification to your Amazon SNS topic.

Delivery of Configuration Items

AWS Config can deliver configuration items through one of the following channels:

Amazon S3 Bucket

AWS Config tracks changes in the configuration of your AWS resources, and it regularly sends updated configuration details to an Amazon S3 bucket that you specify. For each resource type that AWS Config records, it sends a *configuration history file* every six hours. Each configuration history file contains details about the resources that changed in that six-hour period. Each file includes resources of one type, such as Amazon EC2 instances or Amazon EBS volumes. If no configuration changes occur, AWS Config does not send a file.

AWS Config sends a *configuration snapshot* to your Amazon S3 bucket when you use the deliver-config-snapshot command with the AWS CLI, or when you use the DeliverConfigSnapshot action with the AWS Config API. A configuration snapshot contains configuration details for all resources that AWS Config records in your AWS account. The configuration history file and configuration snapshot are in JSON format.

> **Note**
>
> AWS Config only delivers the configuration history files and configuration snapshots to the specified S3 bucket; AWS Config doesn't modify the lifecycle policies for objects in the S3 bucket. You can use lifecycle policies to specify whether you want to delete or archive objects to Amazon Glacier. For more information, see Managing Lifecycle Configuration in the *Amazon Simple Storage Service User Guide*. You can also see the Archiving Amazon S3 Data to Amazon Glacier blog post.

Amazon SNS Topic

An Amazon Simple Notification Service (Amazon SNS) topic is a communication channel that Amazon SNS uses to deliver messages (or *notifications*) to subscribing endpoints such as an email address or clients. Other types of Amazon SNS notifications include push notification messages to apps on mobile phones, Short Message Service (SMS) notifications to SMS-enabled mobile phones

and smart phones, and HTTP POST requests. For best results, use Amazon SQS as the notification endpoint for the SNS topic and then process the information in the notification programmatically.

AWS Config uses the Amazon SNS topic that you specify to send you notifications. The type of notification that you are receiving is indicated by the value for the `messageType` key in the message body, as in the following example:

```
"messageType": "ConfigurationHistoryDeliveryCompleted"
```

The notifications can be any of the following message types.

Message type	Description
ComplianceChangeNotification	The compliance type of a resource that AWS Config evaluates has changed. The compliance type indicates whether the resource complies with a specific AWS Config rule, and it is represented by the `ComplianceType` key in the message. The message includes `newEvaluationResult` and `oldEvaluationResult` objects for comparison.
ConfigRulesEvaluationStarted	AWS Config started evaluating your rule against the specified resources.
ConfigurationSnapshotDeliveryStarted	AWS Config started delivering the configuration snapshot to your Amazon S3 bucket. The name of the Amazon S3 bucket is provided for the `s3Bucket` key in the message.
ConfigurationSnapshotDeliveryCompleted	AWS Config successfully delivered the configuration snapshot to your Amazon S3 bucket.
ConfigurationSnapshotDeliveryFailed	AWS Config failed to deliver the configuration snapshot to your Amazon S3 bucket.

Message type	Description
ConfigurationHistoryDeliveryCompleted	AWS Config successfully delivered the configuration history to your Amazon S3 bucket.
ConfigurationItemChangeNotification	A resource has been created, deleted, or changed in configuration. This message includes the details of the configuration item that AWS Config creates for this change, and it includes the type of change. These notificat ions are delivered within minutes of a change and are collectively known as the *configura tion stream*.
OversizedConfigurationItemChangeNoti fication	This message type is delivered when a configuration item change notification exceeded the maximum size allowed by Amazon SNS. The message includes a summary of the configuration item. With the exception of SMS messages, Amazon SNS messages can contain up to 256 KB of text data, including XML, JSON, and unformatted text. You can view the complete notification in the specified Amazon S3 bucket location.
OversizedConfigurationItemChangeDeli veryFailed	AWS Config failed to deliver the oversized configuration item change notification to your Amazon S3 bucket.

For example notifications, see Notifications that AWS Config Sends to an Amazon SNS topic. For more information about Amazon SNS, see the Amazon Simple Notification Service Developer Guide.

> **Note**
>
> **Why can't I see my latest configuration changes?**

AWS Config usually records configuration changes to your resources right after a change is detected, or at the frequency that you specify. However, this is on a best effort basis and can take longer at times. If issues persist after sometime, contact Support and provide your AWS Config metrics that are supported by Amazon CloudWatch. For information about these metrics, see AWS Config Usage and Success Metrics.

Control Access to AWS Config

AWS Identity and Access Management is a web service that enables Amazon Web Services (AWS) customers to manage users and user permissions.

To provide access, add permissions to your users, groups, or roles:

- Users and groups in AWS IAM Identity Center:

  Create a permission set. Follow the instructions in Create a permission set in the *AWS IAM Identity Center User Guide*.
- Users managed in IAM through an identity provider:

  Create a role for identity federation. Follow the instructions in Create a role for a third-party identity provider (federation) in the *IAM User Guide*.
- IAM users:
  - Create a role that your user can assume. Follow the instructions in Create a role for an IAM user in the *IAM User Guide*.
  - (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in Adding permissions to a user (console) in the *IAM User Guide*.

AWS Config Interfaces

AWS Config Console

You can manage the service using the AWS Config console. For more information about the AWS Management Console, see AWS Management Console.

AWS Config CLI

The AWS Command Line Interface is a unified tool that you can use to interact with AWS Config from the command line. For more information, see the AWS Command Line Interface User Guide. For a complete list of AWS Config CLI commands, see Available Commands.

AWS Config APIs

In addition to the console and the CLI, you can also use the AWS Config RESTful APIs to program AWS Config directly. For more information, see the AWS Config API Reference.

AWS Config SDKs

As an alternative to using the AWS Config API, you can use one of the AWS SDKs. Each SDK consists of libraries and sample code for various programming languages and platforms. The SDKs provide a convenient way to create programmatic access to AWS Config. For example, you can use the SDKs to sign requests cryptographically, manage errors, and retry requests automatically. For more information, see the Tools for Amazon Web Services page.

Resource Management

Understanding the basic components of AWS Config will help you track resource inventory and changes and evaluate configurations of your AWS resources.

AWS Resources

AWS resources are entities that you create and manage using the AWS Management Console, the AWS Command Line Interface (CLI), the AWS SDKs, or AWS partner tools. Examples of AWS resources include Amazon EC2 instances, security groups, Amazon VPCs, and Amazon Elastic Block Store. AWS Config refers to each resource using its unique identifier, such as the resource ID or an Amazon Resource Name (ARN). For a list of resource types that AWS Config supports, see Supported Resource Types for AWS Config.

Resource Relationship

AWS Config discovers AWS resources in your account and then creates a map of relationships between AWS resources. For example, a relationship might include an Amazon EBS volume `vol-123ab45d` attached to an Amazon EC2 instance `i-a1b2c3d4` that is associated with security group `sg-ef678hk`.

For more information, see Supported Resource Types for AWS Config.

Configuration Recorder

The *configuration recorder* stores the configuration changes to the resource types in scope as configuration items. For more information, see Working with the configuration recorder.

There are two types of configuration recorders.

Type	Description
Customer managed configuration recorder	A configuration recorder that you managed. The resource types in scope are set by you. By default, a customer managed configuration recorder records all supported resources in the AWS Region where AWS Config is running.
Service-linked configuration recorder	A configuration recorder that is linked to a specific AWS service. The resource types in scope are set by the linked service.

Delivery Channel

As AWS Config continually records the changes that occur to your AWS resources, it sends notifications and updated configuration states through the *delivery channel*. You can manage the delivery channel to control where AWS Config sends configuration updates.

Configuration Items

A *configuration item* represents a point-in-time view of the various attributes of a supported AWS resource that exists in your account. The components of a configuration item include metadata, attributes, relationships, current configuration, and related events. AWS Config creates a configuration item whenever it detects a change to a resource type that it is recording. For example, if AWS Config is recording Amazon S3 buckets, AWS Config creates a configuration item whenever a bucket is created, updated, or deleted. You can also select for AWS Config to create a configuration item at the recording frequency that you set.

For more information, see Components of a Configuration Item and Recording Frequency.

Configuration History

A *configuration history* is a collection of the configuration items for a given resource over any time period. A configuration history can help you answer questions about, for example, when the resource was first created, how the resource has been configured over the last month, and what configuration changes were introduced yesterday at 9 AM. The configuration history is available to you in multiple formats. AWS Config automatically delivers a configuration history file for each resource type that is being recorded to an Amazon S3 bucket that you specify. You can select a given resource in the AWS Config console and navigate to all previous configuration items for that resource using the timeline. Additionally, you can access the historical configuration items for a resource from the API.

For more information, see Viewing Compliance History and Querying Compliance History.

Configuration Snapshot

A *configuration snapshot* is a collection of the configuration items for the supported resources that exist in your account. This configuration snapshot is a complete picture of the resources that are being recorded and their configurations. The configuration snapshot can be a useful tool for validating your configuration. For example, you may want to examine the configuration snapshot regularly for resources that are configured incorrectly or that potentially should not exist. The configuration snapshot is available in multiple formats. You can have the configuration snapshot delivered to an Amazon Simple Storage Service (Amazon S3) bucket that you specify. Additionally, you can select a point in time in the AWS Config console and navigate through the snapshot of configuration items using the relationships between the resources.

For more information, see Delivering Configuration Snapshots, Viewing Configuration Snapshots, and Example Configuration Snapshot.

Configuration Stream

A *configuration stream* is an automatically updated list of all configuration items for the resources that AWS Config is recording. Every time a resource is created, modified, or deleted, AWS Config creates a configuration item and adds to the configuration stream. The configuration stream works by using an Amazon Simple Notification Service (Amazon SNS) topic of your choice. The configuration stream is helpful for observing configuration changes as they occur so that you can spot potential problems, generating notifications if certain resources are changed, or updating external systems that need to reflect the configuration of your AWS resources.

AWS Config Rules

An AWS Config rule is a compliance check that helps you manage your ideal configuration settings for specific AWS resources. AWS Config evaluates whether your resource configurations comply with relevant rules and displays the compliance results.

Evaluation Results

There are four possible evaluation results for an AWS Config rule.

Evaluation result	Description
`COMPLIANT`	The rule passes the conditions of the compliance check.
`NON_COMPLIANT`	The rule fails the conditions of the compliance check.
`ERROR`	The one of the required/optional parameter s is not valid, not of the correct type, or is formatted incorrectly.
`NOT_APPLICABLE`	Used to filter out resources that the logic of the rule cannot be applied to. For example, the alb-desync-mode-check rule only checks Application Load Balancers, and ignores Network Load Balancers and Gateway Load Balancers.

Rule Types

There are two types of rules. For more information about the structure of rule definitions and rule metadata, see Components of an AWS Config Rule.

Type	Description	More information
Managed rules	Predefined, customizable rules created by AWS Config.	For a list of managed rules, see List of AWS Config Managed Rules.
Custom rules	Rules that you create from scratch. There are two ways to create AWS Config custom rules: Lambda functions (AWS Lambda Developer Guide) and Guard (Guard GitHub Repository)	For more information, see Creating AWS Config Custom Policy Rules and Creating AWS Config Custom Lambda Rules.

Trigger Types

After you add a rule to your account, AWS Config compares your resources to the conditions of the rule. After this initial evaluation, AWS Config continues to run evaluations each time one is triggered. The evaluation triggers are defined as part of the rule, and they can include the following types.

Trigger type	Description
Configuration changes	AWS Config runs evaluations for the rule when there is a resource that matches the rule's scope and there is a change in configuration of the resource. The evaluation runs after AWS Config sends a configuration item change notification. You choose which resources initiate the evaluation by defining the rule's *scope*. The scope can include the following: • One or more resource types • A combination of a resource type and a resource ID

Trigger type	Description
	• A combination of a tag key and value • When any recorded resource is created, updated, or deleted AWS Config runs the evaluation when it detects a change to a resource that matches the rule's scope. You can use the scope to define which resources initiate evaluations.
Periodic	AWS Config runs evaluations for the rule at a frequency that you choose; for example, every 24 hours.
Hybrid	Some rules have both configuration change and periodic triggers. For these rules, AWS Config evaluates your resources when it detects a configuration change and also at the frequency that you specify.

Evaluation modes

There are two evaluation modes for AWS Config rules.

Evaluation mode	Description
Proactive	Use proactive evaluation to evaluate resources before they have been deployed. This allows you to evaluate whether a set of resource properties, if used to define an AWS resource, would be COMPLIANT or NON_COMPLIANT given the set of proactive rules that you have in your account in your Region. For more information, see Evaluation modes. For a list of managed rules that support

Evaluation mode	Description
	proactive evaluation, see List of AWS Config Managed Rules by Evaluation Mode.
Detective	Use detective evaluation to evaluate resources that have already been deployed. This allows you to evaluate the configuration settings of your existing resources.

> **Note**
>
> Proactive rules do not remediate resources that are flagged as NON_COMPLIANT or prevent them from being deployed.

Conformance Packs

A conformance pack is a collection of AWS Config rules and remediation actions that can be easily deployed as a single entity in an account and a Region or across an organization in AWS Organizations.

Conformance packs are created by authoring a YAML template that contains the list of AWS Config managed or custom rules and remediation actions. You can deploy the template by using the AWS Config console or the AWS CLI.

To quickly get started and to evaluate your AWS environment, use one of the sample conformance pack templates. You can also create a conformance pack YAML file from scratch based on Custom Conformance Pack. A custom conformance pack is a unique collection of AWS Config rules and remediation actions that you can deploy together in an account and an AWS Region, or across an organization in AWS Organizations.

Process checks is a type of AWS Config rule that allows you to track your external and internal tasks that require verification as part of the conformance packs. These checks can be added to an existing conformance pack or a new conformance pack. You can track all compliance that includes AWS Configurations and manual checks in a single location.

Multi-Account Multi-Region Data Aggregation

Multi-account multi-region data aggregation in AWS Config allows you to aggregate AWS Config configuration and compliance data from multiple accounts and regions into a single account. Multi-account multi-region data aggregation is useful for central IT administrators to monitor compliance for multiple AWS accounts in the enterprise. Using aggregators does not incur any additional costs.

Source Account

A source account is the AWS account from which you want to aggregate AWS Config resource configuration and compliance data. A source account can be an individual account or an organization in AWS Organizations. You can provide source accounts individually or you can retrieve them through AWS Organizations.

Source Region

A source region is the AWS Region from which you want to aggregate AWS Config configuration and compliance data.

Aggregator

An aggregator collects AWS Config configuration and compliance data from multiple source accounts and regions. Create an aggregator in the region where you want to see the aggregated AWS Config configuration and compliance data.

> **Note**
>
> Aggregators provide a *read-only view* into the source accounts and regions that the aggregator is authorized to view by replicating data from the source accounts into the aggregator account. Aggregators do not provide mutating access into a source account or region. For example, this means that you cannot deploy rules through an aggregator or push snapshot files to a source account or region through an aggregator.

Service-linked aggregator

A service-linked aggregator is linked to a specific AWS service. The configuration and compliance data in scope are set by the linked service.

Aggregator Account

An aggregator account is an account where you create an aggregator.

Authorization

As a source account owner, authorization refers to the permissions you grant to an aggregator account and region to collect your AWS Config configuration and compliance data. Authorization is not required if you are aggregating source accounts that are part of AWS Organizations.

AWS Service Integrations with AWS Config

AWS Config supports integrations with several other AWS services. This list is non-exhaustive.

AWS Organizations

You can use AWS Organizations to define the accounts to use for AWS Config's multi-account, multi-Region data aggregation capability. AWS Organizations is an account management service that helps you consolidate multiple AWS accounts into an organization that you create and centrally manage. By providing your AWS Organizations details, you can monitor the compliance status across your organization. For more information, AWS Config and AWS Organizations in the *AWS Organizations User Guide*.

AWS Control Tower

AWS Control Tower enables AWS Config on all enrolled accounts, so that it can monitor compliance through detective controls, record resource changes, and deliver resource change logs to the log archive account. For more information, see Monitor resource changes with AWS Config in the *AWS Control Tower User Guide*.

AWS CloudTrail

AWS Config integrates with AWS CloudTrail to correlate configuration changes to particular events in your account. You can use the CloudTrail logs to obtain the details of the event that invoked the change, including who made the request, at what time, and from which IP address. You can navigate to the AWS Config timeline from the CloudTrail console to view the configuration changes related to your AWS API activities.

For more information, see Logging AWS Config API Calls with AWS CloudTrail in the *AWS Config Developer Guide* and Create an event data store for AWS Config configuration items with the console in the *AWS CloudTrail User Guide*.

AWS Security Hub CSPM

AWS Security Hub CSPM centralizes security checks from other AWS services, including AWS Config rules. Security Hub enables and controls AWS Config rules to verify your resource configurations are aligned to best practices. Enable AWS Config on all accounts in all Regions where Security Hub CSPM is to run security checks on your environment's resources. For more information, see AWS services that send findings to Security Hub in the *AWS Security Hub CSPM User Guide*.

> **Some Security Hub CSPM-related rules are periodic and do not depend on configuration items**
>
> Some Security Hub CSPM-related rules are periodic. These rule can run without the configuration recorder being enabled and do not depend on configuration items (CI). This means that if you view the rule page, there is no listed CI or supported resource. If you select the resource ID, you will see the following error: `The provided resource ID and resource type cannot be found`. This is expected behavior.

AWS Trusted Advisor

AWS Config managed rules power a set of Trusted Advisor checks across all categories. When you enable certain managed rules, the corresponding Trusted Advisor checks are automatically enabled. To see which Trusted Advisor checks are powered by specific AWS Config managed rules, see AWS Trusted Advisor check reference in the *AWS Support User Guide*.

The AWS Config powered checks are available to customers with AWS Business Support, AWS Enterprise On-Ramp, and AWS Enterprise Support plans. If you enable AWS Config and you have one of these AWS Support plans, then you automatically see recommendations powered by corresponding deployed AWS Config managed rules.

> **Refresh requests are not allowed and resources cannot be excluded**
>
> Results for these checks are automatically refreshed based on change-triggered updates to AWS Config managed rules. Refresh requests are not allowed. Currently, you can't exclude resources from these checks.

For more information, see View Trusted Advisor checks powered by AWS Config in the *AWS Support User Guide*.

AWS Audit Manager

You can use Audit Manager to capture AWS Config evaluations as evidence for audits. When you create or edit a custom control, you can specify one or more AWS Config rules as a data source mapping for evidence collection. AWS Config performs compliance checks based on these rules, and Audit Manager reports the results as compliance check evidence. For more information, see AWS Config Rules supported by AWS Audit Manager in the *AWS Audit Manager User Guide*.

AWS Systems Manager

AWS Config integrates with Systems Manager to record configuration changes to software on your Amazon EC2 instances and servers in your on-premises environment. With this integration, you can gain visibility into operating system (OS) configurations, system-level updates, installed applications, network configuration, and more. AWS Config also provides a history of OS and system-level configuration changes alongside infrastructure configuration changes recorded for Amazon EC2 instances. You can navigate to the AWS Config timeline from the Systems Manager console to view the configuration changes of your managed Amazon EC2 instances. You can use AWS Config to view Systems Manager inventory history and track changes for all your managed instances.

For more information, see Integration with AWS services | Management and Governance, AWS Config configuration recorder, and AWS Config conformance pack deployment in the *AWS Systems Manager User Guide*.

AWS Firewall Manager

To use Firewall Manager, you must enable AWS Config for each of your AWS Organizations member accounts. When new applications are created, Firewall Manager is the single service to build

firewall rules, create security policies, and enforce them consistently. For more information, see Enable AWS Config in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

> **Note**
>
> Firewall Manager depends on continuous recording to monitor your resources. If you are using Firewall Manager, it is recommended that you set the recording frequency to Continuous. For more information on continuous recording and daily recording, see Recording Frequency.

Amazon EC2 Dedicated Hosts

AWS Config integrates with Amazon EC2 Dedicated Hosts to assess license compliance. AWS Config records when instances are launched, stopped, or shut down on a Dedicated Host, and pairs this information with host and instance level information relevant to software licensing, such as Host ID, Amazon Machine Image (AMI) IDs, number of sockets, and physical cores. This helps you use AWS Config as a data source for your license reporting. You can navigate to the AWS Config timeline from the Amazon EC2 Dedicated Hosts console to view the configuration changes of your Amazon EC2 Dedicated Hosts.

For more information, see Track configuration changes in the *Amazon Elastic Compute Cloud User Guide for Linux Instances* or Track configuration changes in the *Amazon Elastic Compute Cloud User Guide for Windows Instances*.

Application Load Balancers

AWS Config integrates with the Elastic Load Balancing (ELB) service to record configuration changes to Application Load Balancers. AWS Config also includes relationships with associated Amazon EC2 security groups, VPCs, and subnets. You can use this information for security analysis and troubleshooting. For example, you can check which security groups are associated with your Application Load Balancer at any point in time. You can navigate to the AWS Config timeline from the ELB console to view the configuration changes of your Application Load Balancers.

AWS CodeBuild

AWS Configprovides an inventory of your AWS resources and a history of configuration changes to these resources. AWS Config supports AWS CodeBuild; as an AWS resource, which means

the service can track your CodeBuild projects. For more information, see Use AWS Config with CodeBuild sample in the *AWS CodeBuild User Guide*.

AWS X-Ray

AWS X-Ray integrates with AWS Config to record configuration changes made to your X-Ray encryption resources. You can use AWS Config to inventory X-Ray encryption resources, audit the X-Ray configuration history, and send notifications based on resource changes. For more information, see Tracking X-Ray encryption configuration changes with AWS Config in the *AWS X-Ray Developer Guide*.

AWS Service Management Connector

The AWS Service Management Connector for ServiceNow can synchronize AWS Config data from multiple accounts and Regions using an Aggregator. For more information, see Integrating AWS Config in ServiceNow in the *AWS Service Management Connector Administrator Guide*.

Amazon API Gateway

You can use AWS Config to record configuration changes made to your API Gateway API resources and send notifications based on resource changes. Maintaining a configuration change history for API Gateway resources is useful for operational troubleshooting, audit, and compliance use cases. For more information, see Monitoring API Gateway API configuration with AWS Config in the *API Gateway Developer Guide*.

Region Support for AWS Config

Considerations

Some features of AWS Config are only supported in a subset of the AWS Regions where AWS Config is supported.

Resource Management

- For a list of which AWS resource types are supported in which Regions, see Resource Coverage by Region Availability.

AWS Config Rules

- For a list of which AWS Config rules are supported in which Regions, see List of AWS Config Managed Rules by Region Availability.
- For a list of Regions which support the organizational deployment of AWS Config rules, see Organizational Rules | Region Support.

Conformance Packs

- For a list of Regions which support conformance packs and the organizational deployment of conformance packs, see Conformance Packs | Region Support.

Remediation

- For a list of Regions which support remediation actions for AWS Config rules, see Remediation Actions | Region Support.

Aggregators

- For a list of Regions which support the aggregators, see Aggregators | Region Support.

Advanced Queries

- For a list of Regions which support advanced queries, see Advanced Queries | Region Support.
- For a list of Regions which support the natural language query processor for advanced queries, see Natural language query processor for advanced queries | Region Support.

List of Supported Regions

The following table lists the AWS Regions where you can enable AWS Config.

Region Name	Region	Endpoint	Protocol	
US East (Ohio)	us-east-2	config.us-east-2.amazonaws.com	HTTPS	
		config-fips.us-east-2.amazonaws.com	HTTPS	

Region Name	Region	Endpoint	Protocol
US East (N. Virginia)	us-east-1	config.us-east-1.amazonaws.com config-fips.us-east-1.amazonaws.com	HTTPS HTTPS
US West (N. California)	us-west-1	config.us-west-1.amazonaws.com config-fips.us-west-1.amazonaws.com	HTTPS HTTPS
US West (Oregon)	us-west-2	config.us-west-2.amazonaws.com config-fips.us-west-2.amazonaws.com	HTTPS HTTPS
Africa (Cape Town)	af-south-1	config.af-south-1.amazonaws.com	HTTPS
Asia Pacific (Hong Kong)	ap-east-1	config.ap-east-1.amazonaws.com	HTTPS
Asia Pacific (Hyderabad)	ap-south-2	config.ap-south-2.amazonaws.com	HTTPS
Asia Pacific (Jakarta)	ap-southeast-3	config.ap-southeast-3.amazonaws.com	HTTPS
Asia Pacific (Malaysia)	ap-southeast-5	config.ap-southeast-5.amazonaws.com	HTTPS

Region Name	Region	Endpoint	Protocol
Asia Pacific (Melbourne)	ap-southeast-4	config.ap-southeast-4.amazonaws.com	HTTPS
Asia Pacific (Mumbai)	ap-south-1	config.ap-south-1.amazonaws.com	HTTPS
Asia Pacific (New Zealand)	ap-southeast-6	config.ap-southeast-6.amazonaws.com	HTTPS
Asia Pacific (Osaka)	ap-northeast-3	config.ap-northeast-3.amazonaws.com	HTTPS
Asia Pacific (Seoul)	ap-northeast-2	config.ap-northeast-2.amazonaws.com	HTTPS
Asia Pacific (Singapore)	ap-southeast-1	config.ap-southeast-1.amazonaws.com	HTTPS
Asia Pacific (Sydney)	ap-southeast-2	config.ap-southeast-2.amazonaws.com	HTTPS
Asia Pacific (Taipei)	ap-east-2	config.ap-east-2.amazonaws.com	HTTPS

Region Name	Region	Endpoint	Protocol
Asia Pacific (Thailand)	ap-southeast-7	config.ap-southeast-7.amazonaws.com	HTTPS
Asia Pacific (Tokyo)	ap-northeast-1	config.ap-northeast-1.amazonaws.com	HTTPS
Canada (Central)	ca-central-1	config.ca-central-1.amazonaws.com	HTTPS
Canada West (Calgary)	ca-west-1	config.ca-west-1.amazonaws.com	HTTPS
Europe (Frankfurt)	eu-central-1	config.eu-central-1.amazonaws.com	HTTPS
Europe (Ireland)	eu-west-1	config.eu-west-1.amazonaws.com	HTTPS
Europe (London)	eu-west-2	config.eu-west-2.amazonaws.com	HTTPS
Europe (Milan)	eu-south-1	config.eu-south-1.amazonaws.com	HTTPS
Europe (Paris)	eu-west-3	config.eu-west-3.amazonaws.com	HTTPS
Europe (Spain)	eu-south-2	config.eu-south-2.amazonaws.com	HTTPS

Region Name	Region	Endpoint	Protocol
Europe (Stockholm)	eu-north-1	config.eu-north-1.amazonaws.com	HTTPS
Europe (Zurich)	eu-central-2	config.eu-central-2.amazonaws.com	HTTPS
Israel (Tel Aviv)	il-central-1	config.il-central-1.amazonaws.com	HTTPS
Mexico (Central)	mx-central-1	config.mx-central-1.amazonaws.com	HTTPS
Middle East (Bahrain)	me-south-1	config.me-south-1.amazonaws.com	HTTPS
Middle East (UAE)	me-central-1	config.me-central-1.amazonaws.com	HTTPS
South America (São Paulo)	sa-east-1	config.sa-east-1.amazonaws.com	HTTPS
AWS GovCloud (US-East)	us-gov-east-1	config.us-gov-east-1.amazonaws.com	HTTPS
AWS GovCloud (US-West)	us-gov-west-1	config.us-gov-west-1.amazonaws.com	HTTPS

Service Limits for AWS Config

The following table describes limits within AWS Config. Unless noted otherwise, the quotas can be increased upon request. You can request a quota increase.

For information about other limits in AWS, see AWS Service Limits.

Resource tags

Description	Limit Value	Can be increased
Maximum number of tags per resource	50	No

AWS Config rules

Description	Limit Value	Can be increased
Maximum number of AWS Config Rules per Region per account	1000	No

Single Account Conformance Packs

Description	Limit Value	Can be increased
Maximum number of conformance packs per account	50	No
Maximum number of AWS Config Rules per conformance pack	130	No

> **Note**
>
> AWS Config rules in conformance packs count in the limit for the Maximum number of AWS Config Rules per Region per account.

Organization Conformance Packs

Description	Limit Value	Can be increased
Maximum number of conformance packs per organization	50	No
Maximum number of AWS Config Rules per organization conformance pack	130	No

> **Note**
>
> Deploying at the organization level counts in the limit for child accounts. AWS Config rules in conformance packs count in the limit for the Maximum number of AWS Config Rules per Region per account.

Aggregators

Description	Limit Value	Can be increased
Maximum number of configuration aggregators	50	Yes
Maximum number of accounts in an aggregator	10000	No
Maximum number of accounts added or deleted per week for all aggregators	1000	Yes

> **Note**
>
> Organization level aggregators and individual account aggregators both count in the limit for the Maximum number of configuration aggregators.

Advanced queries

Description	Limit Value	Can be increased
Maximum number of saved queries in a single account and a Region	300	Yes

Supplemental Information and Related Resources for AWS Config

The following related resources can help you as you work with this service.

- **AWS Config** – The primary web page for information about AWS Config.
- **AWS Config Pricing**
- **Technical FAQ**
- **AWS Config Rule Development Kit (RDK)** – An open-source tool that helps you set up AWS Config, author rules, and then test them using a variety of AWS resource types.
- **Partners** – Links to partner products that are fully integrated with AWS Config to help you visualize, monitor, and manage the data from your configuration stream, configuration snapshots, or configuration history.

- Classes & Workshops – Links to role-based and specialty courses, in addition to self-paced labs to help sharpen your AWS skills and gain practical experience.
- AWS Developer Center – Explore tutorials, download tools, and learn about AWS developer events.
- AWS Developer Tools – Links to developer tools, SDKs, IDE toolkits, and command line tools for developing and managing AWS applications.

- Getting Started Resource Center – Learn how to set up your AWS account, join the AWS community, and launch your first application.
- Hands-On Tutorials – Follow step-by-step tutorials to launch your first application on AWS.
- AWS Whitepapers – Links to a comprehensive list of technical AWS whitepapers, covering topics such as architecture, security, and economics and authored by AWS Solutions Architects or other technical experts.
- AWS Support Center – The hub for creating and managing your AWS Support cases. Also includes links to other helpful resources, such as forums, technical FAQs, service health status, and AWS Trusted Advisor.
- Support – The primary webpage for information about Support, a one-on-one, fast-response support channel to help you build and run applications in the cloud.
- Contact Us – A central contact point for inquiries concerning AWS billing, account, events, abuse, and other issues.
- AWS Site Terms – Detailed information about our copyright and trademark; your account, license, and site access; and other topics.

AWS Software Development Kits for AWS Config

An AWS software development kit (SDK) makes it easier to build applications that access cost-effective, scalable, and reliable AWS infrastructure services. With AWS SDKs, you can get started in minutes with a single, downloadable package that includes the library, code samples, and reference documentation. The following table lists the available SDKs and third-party libraries you can use to access AWS Config programmatically.

Type of Access	Description
AWS SDKs	AWS provides the following SDKs: • AWS SDK for C++ Documentation • AWS Mobile SDK for iOS Documentation • AWS SDK for Go Documentation • AWS SDK for Java Documentation • AWS SDK for JavaScript Documentation • AWS SDK for .NET Documentation

Type of Access	Description
	• AWS SDK for PHP Documentation • AWS SDK for Python (Boto) Documentation • AWS SDK for Ruby Documentation
Third-party libraries	Developers in the AWS developer community also provide their own libraries, which you can find at the following AWS developer centers: • AWS Java Developer Center • AWS JavaScript Developer Center • AWS PHP Developer Center • AWS Python Developer Center • AWS Ruby Developer Center • AWS Windows and .NET Developer Center

Getting Started with AWS Config

AWS Config provides a detailed view of the configuration of AWS resources in your AWS account. With AWS Config, you can review changes in configurations and relationships between AWS resources, explore resource configuration history, and use rules to determine compliance. For more information, see What Is AWS Config? and How AWS Config Works.

Signing up for AWS

Sign up for an AWS account

To get started with AWS, you need an AWS account. There are two ways to sign up for AWS. If you want complete control over account configuration and where your content is stored, or if you have regulated workloads such as HIPAA or FedRAMP, use Sign up for AWS (advanced). If you are a new user and want to use a login you already own to sign in to AWS and create an AWS environment with preconfigured defaults in select AWS Regions, use Sign up for AWS.

Ways to Get Started with AWS Config

After you sign up for an AWS account, you can get started with AWS Config with the AWS Management Console, AWS CLI, or the AWS SDKs.

- Setting Up AWS Config with the Console
- Setting Up AWS Config with the AWS CLI
- Using AWS Config service with the AWS SDK

Setting Up AWS Config with the Console

The AWS Management Console provides a quick and streamlined process for setting up AWS Config.

Setting up

To set up AWS Config with the console

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. If this is the first time you are opening the AWS Config console or you are setting up AWS Config in a new region, the AWS Config console page looks like the following:

3. Choose **1-click setup** to launch AWS Config based on AWS best practices. You can also choose **Get started** to go through a more detailed setup process.

Topics

- 1-click setup for AWS Config
- Manual setup for AWS Config

1-click setup for AWS Config

AWS Config **1-click setup** helps simplify the getting started process for AWS Config console customers by reducing the number of manual selections. To go through all the manual selections of the setup process, see Manual setup.

To set up AWS Config with the console using 1-click setup

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Choose **1-click setup**.

The set up page includes three steps, but through the **1-click setup** workflow, you are automatically directed to Step 3 (Review). The following provides a breakdown of that procedure.

- **Settings**: To select the manner by which the AWS Config console records resources and roles, and choose where configuration history and configuration snapshot files are sent.
- **Rules**: For AWS Regions that support AWS Config rules, this step is available for you to configure initial managed rules that you can add to your account. After setting up, AWS Config will evaluate your AWS resources against the rules that you chose. Additional rules can be created and existing ones can be updated in your account after setup.
- **Review**: To verify your setup details.

Step 1: Settings

Recording strategy

The option to record **All resource types with customizable overrides** is selected for you. AWS Config will record all current and future supported resource types in this Region. For more information, see Supported Resource Types.

- **Default settings**

  The default recording frequency is set to **Continuous** for you. This means AWS Config records configuration changes continuously whenever a change occurs.

  AWS Config also supports the option to set the recording frequency to **Daily**. If you select this option after setup, you will receive a configuration item (CI) representing the most recent state of your resources over the last 24-hour period, only if it's different from the previous CI recorded. For more information see, Recording Frequency.

  > **Note**
  >
  > AWS Firewall Manager depends on continuous recording to monitor your resources. If you are using Firewall Manager, it is recommended that you set the recording frequency to Continuous.

- **Override settings – *optional***

Optionally, after setup you can override the record frequency for specific resource types, or exclude specific resource types from recording. To override the default settings, choose **Settings** in the left navigation of the AWS Config console, and then choose **Edit**.

Considerations When Recording Resources

High Number of AWS Config Evaluations

You might notice increased activity in your account during your initial month recording with AWS Config when compared to subsequent months. During the initial bootstrapping process, AWS Config runs evaluations on all the resources in your account that you have selected for AWS Config to record.

If you are running ephemeral workloads, you may see increased activity from AWS Config as it records configuration changes associated with creating and deleting these temporary resources. An *ephemeral workload* is a temporary use of computing resources that are loaded and run when needed. Examples include Amazon Elastic Compute Cloud (Amazon EC2) Spot Instances, Amazon EMR jobs, and AWS Auto Scaling. If you want to avoid the increased activity from running ephemeral workloads, you can set up the configuration recorder to exclude these resource types from being recorded, or run these types of workloads in a separate account with AWS Config turned off to avoid increased configuration recording and rule evaluations.

Global resource types | Aurora global clusters are initially included in recording

The `AWS::RDS::GlobalCluster` resource type will be recorded in all supported AWS Config Regions where the configuration recorder is enabled.

If you do not want to record `AWS::RDS::GlobalCluster` in all enabled Regions, you can exclude this resource type from recording after setup. Choose **Settings** in the left navigation bar, and then choosing **Edit**. From **Edit**, go to **Override settings** in the **Recording method** section, choose `AWS::RDS::GlobalCluster`, and choose the override "Exclude from recording".

Global resource types | IAM resource types are initially excluded from recording

"All globally recorded IAM resource types" are initially excluded from recording to help you reduce costs. This bundle includes IAM users, groups, roles, and customer managed policies. Choose **Remove** to remove the override and include these resources in your recording.

Additionally, the global IAM resource types (`AWS::IAM::User`, `AWS::IAM::Group`, `AWS::IAM::Role`, and `AWS::IAM::Policy`) cannot be recorded in Regions supported by AWS

Config after February 2022. For a list of those Regions, see Recording AWS Resources | Global Resources.

Data governance

The default data retention period to retain AWS Config data for 7 years (2557 days) is selected for you in this section.

The option to **Use an existing AWS Config service-linked role** is selected for you and set to the **AWS Config role**. Service-linked roles are predefined by AWS Config and include all the permissions that the service requires to call other AWS services.

Delivery method

The option to **Choose a bucket from your account** is selected for you in this section. This selection will default to the bucket in your account that is named in the format `config-bucket-`*`accountid`*. For example, `config-bucket-012345678901`. If you don't have a bucket created in that format, one will be created for you. If you want to create your own bucket, see Creating a bucket in the *Amazon Simple Storage Service User Guide*.

For more information about S3 buckets, see Buckets overview in the *Amazon Simple Storage Service User Guide*.

Step 2: Rules

Under **AWS Managed Rules**, no rules are selected for you at this step. Instead, you are encouraged to create and update rules after you have finished setting up your account.

Step 3: Review

Review your AWS Config setup details. You can go back to edit changes for each section. Choose **Confirm** to finish setting up AWS Config.

Manual setup for AWS Config

With the **Get started** workflow, you can go through all the manual selections of the setup process to get started with the AWS Config console. For a simplified getting started process, see 1-click setup.

To set up AWS Config with the console using Get started

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Choose **Get started**.

The setup page includes three steps. The following provides a breakdown of that procedure after you choose **Get started**.

- **Settings**: To select the manner by which the AWS Config console records resources and roles, and choose where configuration history and configuration snapshot files are sent.
- **Rules**: For AWS Regions that support AWS Config rules, this step is available for you to configure initial managed rules that you can add to your account. After setting up, AWS Config will evaluate your AWS resources against the rules that you chose. Additional rules can be created and existing ones can be updated and in your account after setup.
- **Review**: To verify your setup details.

Step 1: Settings

Recording strategy

In the **Recording method** section, choose a recording strategy. You can specify the AWS resources that you want AWS Config to record.

All resource types with customizable overrides

Set up AWS Config to record configuration changes for all current and future supported resource types in this Region. You can override the recording frequency for specific resource types or exclude specific resource types from recording. For more information, see Supported Resource Types.

- **Default settings**

  Configure the default recording frequency for all current and future supported resource types. For more information see, Recording Frequency.

  - Continuous recording – AWS Config will record configuration changes continuously whenever a change occurs.

- Daily recording – You will receive a configuration item (CI) representing the most recent state of your resources over the last 24-hour period, only if it's different from the previous CI recorded.

> **Note**
>
> AWS Firewall Manager depends on continuous recording to monitor your resources. If you are using Firewall Manager, it is recommended that you set the recording frequency to Continuous.

- **Override settings**

  Override the recording frequency for specific resource types, or exclude specific resource types from recording. If you change the recording frequency for a resource type or stop recording a resource type, the configuration items that were already recorded will remain unchanged.

Specific resource types

Set AWS Config to record configuration changes for only the resource types that you specify.

- **Specific resource types**

  Choose a resource type to record and its frequency. For more information see, Recording Frequency.

  - Continuous recording – AWS Config will record configuration changes continuously whenever a change occurs.
  - Daily recording – You will receive a configuration item (CI) representing the most recent state of your resources over the last 24-hour period, only if it's different from the previous CI recorded.

> **Note**
>
> AWS Firewall Manager depends on continuous recording to monitor your resources. If you are using Firewall Manager, it is recommended that you set the recording frequency to Continuous.

If you change the recording frequency for a resource type or stop recording a resource type, the configuration items that were already recorded will remain unchanged.

Considerations When Recording Resources

High Number of AWS Config Evaluations

You might notice increased activity in your account during your initial month recording with AWS Config when compared to subsequent months. During the initial bootstrapping process, AWS Config runs evaluations on all the resources in your account that you have selected for AWS Config to record.

If you are running ephemeral workloads, you may see increased activity from AWS Config as it records configuration changes associated with creating and deleting these temporary resources. An *ephemeral workload* is a temporary use of computing resources that are loaded and run when needed. Examples include Amazon Elastic Compute Cloud (Amazon EC2) Spot Instances, Amazon EMR jobs, and AWS Auto Scaling. . If you want to avoid the increased activity from running ephemeral workloads, you can set up the configuration recorder to exclude these resource types from being recorded, or run these types of workloads in a separate account with AWS Config turned off to avoid increased configuration recording and rule evaluations.

Considerations: All resource types with customizable overrides

Globally recorded resource types | Aurora global clusters are initially included in recording

The `AWS::RDS::GlobalCluster` resource type will be recorded in all supported AWS Config Regions where the configuration recorder is enabled.

If you do not want to record `AWS::RDS::GlobalCluster` in all enabled Regions, choose "AWS RDS GlobalCluster", and choose the override "Exclude from recording".

Global resource types | IAM resource types are initially excluded from recording

The global IAM resource types are initially excluded from recording to help you reduce costs. This bundle includes IAM users, groups, roles, and customer managed policies. Choose **Remove** to remove the override and include these resources in your recording.

Additionally, the global IAM resource types (`AWS::IAM::User`, `AWS::IAM::Group`, `AWS::IAM::Role`, and `AWS::IAM::Policy`) cannot be recorded in Regions supported by AWS

Config after February 2022. For a list of those Regions, see Recording AWS Resources | Global Resources.

Limits

You can add up to 100 frequency overrides and 600 exclusion overrides.

Daily recording cannot be specified for the following resource types:

- `AWS::Config::ResourceCompliance`
- `AWS::Config::ConformancePackCompliance`
- `AWS::Config::ConfigurationRecorder`

Considerations: Specific resource types

Region Availability

Before specifying a resource type for AWS Config to track, check Resource Coverage by Region Availability to see if the resource type is supported in the AWS Region where you set up AWS Config. If a resource type is supported by AWS Config in at least one Region, you can enable the recording of that resource type in all Regions supported by AWS Config, even if the specified resource type is not supported in the AWS Region where you set up AWS Config.

Limits

No limits if all resource types have the same frequency. You can add up to 100 resource types with Daily frequency if at least one resource type is set to Continuous.

The Daily frequency is not supported for the following resource types:

- `AWS::Config::ResourceCompliance`
- `AWS::Config::ConformancePackCompliance`
- `AWS::Config::ConfigurationRecorder`

Data governance

- For **Data retention period**, choose either the default retention period to retain AWS Config data for 7 years (2557) or set a custom rentention period for items recorded by AWS Config.

AWS Config allows you to delete your data by specifying a retention period for your `ConfigurationItems`. When you specify a retention period, AWS Config retains your `ConfigurationItems` for that specified period. You can choose a period between a minimum of 30 days and a maximum of 7 years (2557 days). AWS Config deletes data older than your specified retention period.

- For **IAM role for AWS Config**, choose either an existing AWS Config service-linked role or an IAM role from your account.
  - Service-linked roles are predefined by AWS Config and include all the permissions that the service requires to call other AWS services.

> **Note**
>
> **Recommended: Use the Service-linked role**
> It is recommended that you use the service-linked role. A service-linked role adds all the necessary permissions for AWS Config to run as expected.

  - Otherwise, choose an IAM role from one of your pre-existing roles and permission policies.

> **Note**
>
> **Policies and compliance results**
> IAM policies and other policies managed in AWS Organizations can impact whether AWS Config has permissions to record configuration changes for your resources. Additionally, rules directly evaluate the configuration of a resource and rules don't take into account these policies when running evaluations. Make sure that the policies in effect align with how you intend to use AWS Config.
> **Keep Minimum Permisions When Reusing an IAM role**
> If you use an AWS service that uses AWS Config, such as AWS Security Hub CSPM or AWS Control Tower, and an IAM role has already been created, make sure that the IAM role that you use when setting up AWS Config keeps the same minimum permissions as the pre-existing IAM role. You must do this to ensure that the other AWS service continues to run as expected.
> For example, if AWS Control Tower has an IAM role that allows AWS Config to read S3 objects, make sure that the same permissions are granted to the IAM role you use when setting up AWS Config. Otherwise, it may interfere with how AWS Control Tower operates.

Delivery method

- For **Delivery method**, choose the S3 bucket to which AWS Config sends configuration history and configuration snapshot files:
  - **Create a bucket** – For **S3 bucket name**, type a name for your S3 bucket.

    The name that you type must be unique across all existing bucket names in Amazon S3. One way to help ensure uniqueness is to include a prefix; for example, the name of your organization. You can't change the bucket name after it is created. For more information, see Bucket Restrictions and Limitations in the *Amazon Simple Storage Service User Guide*.
  - **Choose a bucket from your account** – For **S3 bucket name**, choose your preferred bucket.
  - **Choose a bucket from another account** – For **S3 bucket name**, type the bucket name.

    > **Note**
    >
    > **Bucket Permissions**
    > If you choose a bucket from another account, that bucket must have policies that grant access permissions to AWS Config. For more information, see Permissions for the Amazon S3 Bucket for the AWS Config Delivery Channel.

- For **Amazon SNS topic**, choose **Stream configuration changes and notifications to an Amazon SNS topic** to have AWS Config send notifications such as configuration history delivery, configuration snapshot delivery, and compliance.
- If you chose to have AWS Config stream to an Amazon SNS topic, choose the target topic:
  - **Create a topic** – For **Topic Name**, type a name for your SNS topic.
  - **Choose a topic from your account** – For **Topic Name**, select your preferred topic.
  - **Choose a topic from another account** – For **Topic ARN**, type the Amazon Resource Name (ARN) of the topic. If you choose a topic from another account, the topic must have policies that grant access permissions to AWS Config. For more information, see Permissions for the Amazon SNS Topic.

    > **Note**
    >
    > **Region for the Amazon SNS Topic**
    > The Amazon SNS topic must exist in the same Region as the Region in which you set up AWS Config.

Step 2: Rules

If you are setting up AWS Config in a Region that supports rules, choose **Next**.

Step 3: Review

Review your AWS Config set up details. You can go back to edit changes for each section. Choose **Confirm** to finish setting up AWS Config.

For more information

For information about looking up the existing resources in your account and understanding the configurations of your resources, see Looking up Resources, Viewing Compliance Informance, and Viewing Compliance History.

You can also use Amazon Simple Queue Service to monitor AWS resources programmatically. For more information, see Monitoring AWS Resource Changes with Amazon SQS.

Setting Up AWS Config with the AWS CLI

The AWS CLI is a unified tool to manage your AWS services. With just one tool to download and configure, you can control multiple AWS services from the command line and use scripts to automate them. For more information about the AWS CLI and for instructions on installing the AWS CLI tools, see the following in the *AWS Command Line Interface User Guide*.

- AWS Command Line Interface User Guide
- Getting Set Up with the AWS Command Line Interface

If necessary, enter `aws configure` to configure the AWS CLI to use an AWS Region where AWS Config is available.

Setting up

See the following topics to set up AWS Config with the AWS CLI.

Topics

- Prerequisites for Setting Up AWS Config with the AWS CLI
- Starting AWS Config with a customer managed configuration recorder using the AWS CLI
- Verifying that AWS Config is Successfully Started with the AWS CLI

Prerequisites for Setting Up AWS Config with the AWS CLI

Before setting up AWS with the AWS CLI, you need to create an Amazon S3 bucket, an Amazon SNS topic, and an IAM role with attached policies as prerequisites. You can then use the AWS CLI to specify the bucket, topic, and role for AWS Config. Follow this procedure to set up your prerequisites for AWS Config.

Topics

- Step 1: Creating an Amazon S3 Bucket
- Step 2: Creating an Amazon SNS Topic
- Step 3: Creating an IAM Role

Step 1: Creating an Amazon S3 Bucket

If you already have an Amazon S3 bucket in your account and want to use it, skip this step and go to Step 2: Creating an Amazon SNS Topic.

Using the S3 console

To create a bucket

1. Open the Amazon S3 console at https://console.aws.amazon.com/s3/.
2. Choose **Create bucket**.
3. In **Bucket name**, enter a DNS-compliant name for your bucket.

   The bucket name must:

   - Be unique across all of Amazon S3.
   - Be between 3 and 63 characters long.
   - Not contain uppercase characters.
   - Start with a lowercase letter or number.

   After you create the bucket, you can't change its name. Make sure the bucket name you choose is unique across all existing bucket names in Amazon S3. For more information on bucket naming rules and conventions, see Bucket restrictions and Limitations in the *Amazon Simple Storage Service User Guide*.

> **Important**
>
> Avoid including sensitive information in the bucket name. The bucket name is visible in the URLs that point to the objects in the bucket.

4. In **Region**, choose the AWS Region where you want the bucket to reside.

   Choose a Region close to you to minimize latency and costs and address regulatory requirements. Objects stored in a Region never leave that Region unless you explicitly transfer them to another Region. For a list of Amazon S3 AWS Regions, see AWS service endpoints in the *Amazon Web Services General Reference*.

5. In **Bucket settings for Block Public Access**, choose the Block Public Access settings that you want to apply to the bucket.

   We recommend that you leave all settings enabled unless you know you need to turn one or more of them off for your use case, such as to host a public website. Block public access settings that you enable for the bucket will also be enabled for all access points that you create on the bucket. For more information about blocking public access, see Using Amazon S3 Block Public Access in the *Amazon Simple Storage Service User Guide*.

6. (Optional) If you want to enable S3 Object Lock:

   a. Choose **Advanced settings**, and read the message that appears.

   > **Important**
   >
   > You can only enable S3 Object Lock for a bucket when you create it. If you enable Object Lock for the bucket, you can't disable it later. Enabling Object Lock also enables versioning for the bucket. After you enable Object Lock for the bucket, you must configure the Object Lock settings before any objects in the bucket will be protected. For more information about configuring protection for objects, see Configuring S3 Object Lock using the Amazon S3 console.

   b. If you want to enable Object Lock, enter *enable* in the text box and choose **Confirm**.

   For more information about the S3 Object Lock feature, see Locking Objects Using Amazon S3 Object Lock in the *Amazon Simple Storage Service User Guide*.

7. Choose **Create bucket**.

Using the AWS SDKs

When you use the AWS SDKs to create a bucket, you must create a client and then use the client to send a request to create a bucket. As a best practice, you should create your client and bucket in the same AWS Region. If you don't specify a Region when you create a client or a bucket, Amazon S3 uses the default Region US East (N. Virginia).

To create a client to access a dual-stack endpoint, you must specify an AWS Region. For more information, see Amazon S3 dual-stack endpoints. For a list of available AWS Regions, see Regions and endpoints in the *AWS General Reference*.

When you create a client, the Region maps to the Region-specific endpoint. The client uses this endpoint to communicate with Amazon S3: `s3.<region>.amazonaws.com`. If your Region launched after March 20, 2019, your client and bucket must be in the same Region. However, you can use a client in the US East (N. Virginia) Region to create a bucket in any Region that launched before March 20, 2019. For more information, see Legacy Endpoints.

These AWS SDK code examples perform the following tasks:

- **Create a client by explicitly specifying an AWS Region** — In the example, the client uses the `s3.us-west-2.amazonaws.com` endpoint to communicate with Amazon S3. You can specify any AWS Region. For a list of AWS Regions, see Regions and endpoints in the *AWS General Reference*.
- **Send a create bucket request by specifying only a bucket name** — The client sends a request to Amazon S3 to create the bucket in the Region where you created a client.
- **Retrieve information about the location of the bucket** — Amazon S3 stores bucket location information in the *location* subresource that is associated with the bucket.

The following code examples show how to use `CreateBucket`.

.NET

SDK for .NET (v4)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
/// <summary>
/// Shows how to create a new Amazon S3 bucket.
/// </summary>
/// <param name="bucketName">The name of the bucket to create.</param>
/// <returns>A boolean value representing the success or failure of
/// the bucket creation process.</returns>
public async Task<bool> CreateBucketAsync(string bucketName)
{
    try
    {
        var request = new PutBucketRequest
        {
            BucketName = bucketName,
            UseClientRegion = true,
        };

        var response = await _amazonS3.PutBucketAsync(request);
        return response.HttpStatusCode == System.Net.HttpStatusCode.OK;
    }
    catch (AmazonS3Exception ex)
    {
        Console.WriteLine($"Error creating bucket: '{ex.Message}'");
        return false;
    }
}
```

- For API details, see CreateBucket in *AWS SDK for .NET API Reference*.

SDK for .NET

Create a bucket with object lock enabled.

```
    /// <summary>
    /// Create a new Amazon S3 bucket with object lock actions.
    /// </summary>
    /// <param name="bucketName">The name of the bucket to create.</param>
    /// <param name="enableObjectLock">True to enable object lock on the
bucket.</param>
    /// <returns>True if successful.</returns>
    public async Task<bool> CreateBucketWithObjectLock(string bucketName, bool
enableObjectLock)
    {
        Console.WriteLine($"\tCreating bucket {bucketName} with object lock
{enableObjectLock}.");
        try
        {
            var request = new PutBucketRequest
            {
                BucketName = bucketName,
                UseClientRegion = true,
                ObjectLockEnabledForBucket = enableObjectLock,
            };

            var response = await _amazonS3.PutBucketAsync(request);

            return response.HttpStatusCode == System.Net.HttpStatusCode.OK;
        }
        catch (AmazonS3Exception ex)
        {
            Console.WriteLine($"Error creating bucket: '{ex.Message}'");
            return false;
        }
    }
```

- For API details, see CreateBucket in *AWS SDK for .NET API Reference*.

Bash

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::S3::createBucket(const Aws::String &bucketName,
                              const Aws::S3::S3ClientConfiguration &clientConfig)
 {
    Aws::S3::S3Client client(clientConfig);
    Aws::S3::Model::CreateBucketRequest request;
    request.SetBucket(bucketName);

    if (clientConfig.region != "us-east-1") {
        Aws::S3::Model::CreateBucketConfiguration createBucketConfig;
        createBucketConfig.SetLocationConstraint(

 Aws::S3::Model::BucketLocationConstraintMapper::GetBucketLocationConstraintForName(
                        clientConfig.region));
        request.SetCreateBucketConfiguration(createBucketConfig);
    }

    Aws::S3::Model::CreateBucketOutcome outcome = client.CreateBucket(request);
    if (!outcome.IsSuccess()) {
        auto err = outcome.GetError();
        std::cerr << "Error: createBucket: " <<
                  err.GetExceptionName() << ": " << err.GetMessage() <<
 std::endl;
    } else {
        std::cout << "Created bucket " << bucketName <<
                  " in the specified AWS Region." << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see CreateBucket in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

Example 1: To create a bucket

The following `create-bucket` example creates a bucket named `amzn-s3-demo-bucket`.

```
aws s3api create-bucket \
    --bucket amzn-s3-demo-bucket \
    --region us-east-1
```

Output:

```
{
    "Location": "/amzn-s3-demo-bucket"
}
```

For more information, see Creating a bucket in the *Amazon S3 User Guide*.

Example 2: To create a bucket with owner enforced

The following `create-bucket` example creates a bucket named `amzn-s3-demo-bucket` that uses the bucket owner enforced setting for S3 Object Ownership.

```
aws s3api create-bucket \
    --bucket amzn-s3-demo-bucket \
    --region us-east-1 \
    --object-ownership BucketOwnerEnforced
```

Output:

```
{
    "Location": "/amzn-s3-demo-bucket"
}
```

For more information, see Controlling ownership of objects and disabling ACLs in the *Amazon S3 User Guide*.

Example 3: To create a bucket outside of the ``us-east-1`` region

The following `create-bucket` example creates a bucket named `amzn-s3-demo-bucket` in the `us-west-2` region. Regions outside of `us-east-1` require the appropriate `LocationConstraint` to be specified in order to create the bucket in the desired region.

```
aws s3api create-bucket \
    --bucket amzn-s3-demo-bucket \
    --region us-west-2 \
    --create-bucket-configuration LocationConstraint=us-west-2
```

Output:

```
{
    "Location": "http://amzn-s3-demo-bucket.s3.amazonaws.com/"
}
```

For more information, see Creating a bucket in the *Amazon S3 User Guide*.

- For API details, see CreateBucket in *AWS CLI Command Reference*.

            throw error
        }
    }
```

- For API details, see CreateBucket in *AWS SDK for Swift API reference*.

> **Note**
>
> You can also use an Amazon S3 bucket from a different account, but you may need to create a policy for the bucket that grants access permissions to AWS Config. For information on granting permissions to an Amazon S3 bucket, see Permissions for the Amazon S3 Bucket for the AWS Config Delivery Channel, and then go to Step 2: Creating an Amazon SNS Topic.

Step 2: Creating an Amazon SNS Topic

If you already have an Amazon SNS topic in your account and want to use it, skip this step and go to Step 3: Creating an IAM Role.

Using the SNS console

To create an Amazon SNS topic

1. Open the Amazon SNS console at https://console.aws.amazon.com/sns/v3/home.
2. Do one of the following:
   - If no topics have ever been created under your AWS account before, read the description of Amazon SNS on the home page.
   - If topics have been created under your AWS account before, on the navigation panel, choose **Topics**.
3. On the **Topics** page, choose **Create topic**.
4. On the **Create topic** page, in the **Details** section, do the following:
   a. For **Type**, choose a topic type (**Standard** or **FIFO**).

b. Enter a **Name** for the topic. For a FIFO topic, add **.fifo** to the end of the name.

c. (Optional) Enter a **Display name** for the topic.

d. (Optional) For a FIFO topic, you can choose **content-based message deduplication** to enable default message deduplication. For more information, see Message deduplication for FIFO topics.

5. (Optional) Expand the **Encryption** section and do the following. For more information, see Encryption at rest.

   a. Choose **Enable encryption**.

   b. Specify the customer master key (CMK). For more information, see Key terms.

      For each CMK type, the **Description**, **Account**, and **CMK ARN** are displayed.

      > **Important**
      >
      > If you aren't the owner of the CMK, or if you log in with an account that doesn't have the `kms:ListAliases` and `kms:DescribeKey` permissions, you won't be able to view information about the CMK on the Amazon SNS console.
      > Ask the owner of the CMK to grant you these permissions. For more information, see the AWS KMS API Permissions: Actions and Resources Reference in the *AWS Key Management Service Developer Guide*.

      - The AWS managed CMK for Amazon SNS **(Default) alias/aws/sns** is selected by default.

        > **Note**
        >
        > Keep the following in mind:
        >
        > - The first time you use the AWS Management Console to specify the AWS managed CMK for Amazon SNS for a topic, AWS KMS creates the AWS managed CMK for Amazon SNS.
        > - Alternatively, the first time you use the `Publish` action on a topic with SSE enabled, AWS KMS creates the AWS managed CMK for Amazon SNS.

      - To use a custom CMK from your AWS account, choose the **Customer master key (CMK)** field and then choose the custom CMK from the list.

> **Note**
>
> For instructions on creating custom CMKs, see Creating Keys in the *AWS Key Management Service Developer Guide*

- To use a custom CMK ARN from your AWS account or from another AWS account, enter it into the **Customer master key (CMK)** field.

6. (Optional) By default, only the topic owner can publish or subscribe to the topic. To configure additional access permissions, expand the **Access policy** section. For more information, see Identity and access management in Amazon SNS and Example cases for Amazon SNS access control.

> **Note**
>
> When you create a topic using the console, the default policy uses the `aws:SourceOwner` condition key. This key is similar to `aws:SourceAccount`.

7. (Optional) To configure how Amazon SNS retries failed message delivery attempts, expand the **Delivery retry policy (HTTP/S)** section. For more information, see Amazon SNS message delivery retries.
8. (Optional) To configure how Amazon SNS logs the delivery of messages to CloudWatch, expand the **Delivery status logging** section. For more information, see Amazon SNS message delivery status.
9. (Optional) To add metadata tags to the topic, expand the **Tags** section, enter a **Key** and a **Value** (optional) and choose **Add tag**. For more information, see Amazon SNS topic tagging.
10. Choose **Create topic**.

    The topic is created and the ***MyTopic*** page is displayed.

    The topic's **Name**, **ARN**, (optional) **Display name**, and **Topic owner**'s AWS account ID are displayed in the **Details** section.
11. Copy the topic ARN to the clipboard, for example:

```
arn:aws:sns:us-east-2:123456789012:MyTopic
```

To subscribe an email address to the Amazon SNS topic

1. Open the Amazon SNS console at https://console.aws.amazon.com/sns/v3/home.
2. In the left navigation pane, choose **Subscriptions**.
3. On the **Subscriptions** page, choose **Create subscription**.
4. On the **Create subscription** page, in the **Details** section, do the following:

   a. For **Topic ARN**, choose the Amazon Resource Name (ARN) of a topic.

   b. For **Protocol**, choose an endpoint type. The available endpoint types are:

      - HTTP/HTTPS
      - Email/Email-JSON
      - Amazon Data Firehose
      - Amazon SQS

      > **Note**
      >
      > To subscribe to an SNS FIFO topic, choose this option.

      - AWS Lambda
      - Platform application endpoint
      - SMS

   c. For **Endpoint**, enter the endpoint value, such as an email address or the ARN of an Amazon SQS queue.

   d. Firehose endpoints only: For **Subscription role ARN**, specify the ARN of the IAM role that you created for writing to Firehose delivery streams. For more information, see Prerequisites for subscribing Firehose delivery streams to Amazon SNS topics.

   e. (Optional) For Firehose, Amazon SQS, HTTP/S endpoints, you can also enable raw message delivery. For more information, see Amazon SNS raw message delivery.

   f. (Optional) To configure a filter policy, expand the **Subscription filter policy** section. For more information, see Amazon SNS subscription filter policies.

   g. (Optional) To configure a dead-letter queue for the subscription, expand the **Redrive policy (dead-letter queue)** section. For more information, see Amazon SNS dead-letter queues (DLQs).

   h. Choose **Create subscription**.

The console creates the subscription and opens the subscription's **Details** page.

Using the AWS SDKs

To use an AWS SDK, you must configure it with your credentials. For more information, see The shared config and credentials files in the *AWS SDKs and Tools Reference Guide*.

The following code examples show how to use `CreateTopic`.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Create a topic with a specific name.

```
using System;
using System.Threading.Tasks;
using Amazon.SimpleNotificationService;
using Amazon.SimpleNotificationService.Model;

/// <summary>
/// This example shows how to use Amazon Simple Notification Service
/// (Amazon SNS) to add a new Amazon SNS topic.
/// </summary>
public class CreateSNSTopic
{
    public static async Task Main()
    {
        string topicName = "ExampleSNSTopic";

        IAmazonSimpleNotificationService client = new
AmazonSimpleNotificationServiceClient();

        var topicArn = await CreateSNSTopicAsync(client, topicName);
        Console.WriteLine($"New topic ARN: {topicArn}");
```

```
        }

        /// <summary>
        /// Creates a new SNS topic using the supplied topic name.
        /// </summary>
        /// <param name="client">The initialized SNS client object used to
        /// create the new topic.</param>
        /// <param name="topicName">A string representing the topic name.</param>
        /// <returns>The Amazon Resource Name (ARN) of the created topic.</
returns>
        public static async Task<string>
 CreateSNSTopicAsync(IAmazonSimpleNotificationService client, string topicName)
        {
            var request = new CreateTopicRequest
            {
                Name = topicName,
            };

            var response = await client.CreateTopicAsync(request);

            return response.TopicArn;
        }
    }
```

Create a new topic with a name and specific FIFO and de-duplication attributes.

```
    /// <summary>
    /// Create a new topic with a name and specific FIFO and de-duplication
 attributes.
    /// </summary>
    /// <param name="topicName">The name for the topic.</param>
    /// <param name="useFifoTopic">True to use a FIFO topic.</param>
    /// <param name="useContentBasedDeduplication">True to use content-based de-
duplication.</param>
    /// <returns>The ARN of the new topic.</returns>
    public async Task<string> CreateTopicWithName(string topicName, bool
 useFifoTopic, bool useContentBasedDeduplication)
    {
        var createTopicRequest = new CreateTopicRequest()
        {
            Name = topicName,
```

```
        };

        if (useFifoTopic)
        {
            // Update the name if it is not correct for a FIFO topic.
            if (!topicName.EndsWith(".fifo"))
            {
                createTopicRequest.Name = topicName + ".fifo";
            }

            // Add the attributes from the method parameters.
            createTopicRequest.Attributes = new Dictionary<string, string>
            {
                { "FifoTopic", "true" }
            };
            if (useContentBasedDeduplication)
            {
                createTopicRequest.Attributes.Add("ContentBasedDeduplication",
"true");
            }
        }

        var createResponse = await
_amazonSNSClient.CreateTopicAsync(createTopicRequest);
        return createResponse.TopicArn;
    }
```

- For API details, see CreateTopic in *AWS SDK for .NET API Reference*.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
//! Create an Amazon Simple Notification Service (Amazon SNS) topic.
/*!
```

```
  \param topicName: An Amazon SNS topic name.
  \param topicARNResult: String to return the Amazon Resource Name (ARN) for the
 topic.
  \param clientConfiguration: AWS client configuration.
  \return bool: Function succeeded.
 */
bool AwsDoc::SNS::createTopic(const Aws::String &topicName,
                              Aws::String &topicARNResult,
                              const Aws::Client::ClientConfiguration
 &clientConfiguration) {
    Aws::SNS::SNSClient snsClient(clientConfiguration);

    Aws::SNS::Model::CreateTopicRequest request;
    request.SetName(topicName);

    const Aws::SNS::Model::CreateTopicOutcome outcome =
 snsClient.CreateTopic(request);

    if (outcome.IsSuccess()) {
        topicARNResult = outcome.GetResult().GetTopicArn();
        std::cout << "Successfully created an Amazon SNS topic " << topicName
                  << " with topic ARN '" << topicARNResult
                  << "'." << std::endl;

    }
    else {
        std::cerr << "Error creating topic " << topicName << ":" <<
                  outcome.GetError().GetMessage() << std::endl;
        topicARNResult.clear();
    }

    return outcome.IsSuccess();
}
```

- For API details, see CreateTopic in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To create an SNS topic

The following `create-topic` example creates an SNS topic named `my-topic`.

```
aws sns create-topic \
    --name my-topic
```

Output:

```
{
    "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic"
}
```

For more information, see Using the AWS Command Line Interface with Amazon SQS and Amazon SNS in the *AWS Command Line Interface User Guide*.

- For API details, see CreateTopic in *AWS CLI Command Reference*.

Go

SDK for Go V2

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Create the client in a separate module and export it.

```
import { SNSClient } from "@aws-sdk/client-sns";

// The AWS Region can be provided here using the `region` property. If you leave
 it blank
// the SDK will default to the region set in your AWS config.
export const snsClient = new SNSClient({});
```

Import the SDK and client modules and call the API.

```
import { CreateTopicCommand } from "@aws-sdk/client-sns";
import { snsClient } from "../libs/snsClient.js";

/**
 * @param {string} topicName - The name of the topic to create.
 */
export const createTopic = async (topicName = "TOPIC_NAME") => {
  const response = await snsClient.send(
    new CreateTopicCommand({ Name: topicName }),
  );
  console.log(response);
  // {
  //   '$metadata': {
  //     httpStatusCode: 200,
  //     requestId: '087b8ad2-4593-50c4-a496-d7e90b82cf3e',
  //     extendedRequestId: undefined,
  //     cfId: undefined,
  //     attempts: 1,
  //     totalRetryDelay: 0
  //   },
  //   TopicArn: 'arn:aws:sns:us-east-1:xxxxxxxxxxxx:TOPIC_NAME'
  // }
  return response;
};
```

Swift

SDK for Swift

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import AWSSNS

        let config = try await SNSClient.SNSClientConfig(region: region)
        let snsClient = SNSClient(config: config)
```

```
        let output = try await snsClient.createTopic(
            input: CreateTopicInput(name: name)
        )

        guard let arn = output.topicArn else {
            print("No topic ARN returned by Amazon SNS.")
            return
        }
```

- For API details, see CreateTopic in *AWS SDK for Swift API reference*.

> **Note**
>
> You can also use an Amazon SNS topic in a different account, but in that case you might need to create a policy for topic that grants access permissions to AWS Config. For information on granting permissions to an Amazon SNS topic, see Permissions for the Amazon SNS Topic and then go to Step 3: Creating an IAM Role.

Step 3: Creating an IAM Role

> **Important**
>
> **(Recommended) Use the AWS Config service-linked role**
> It is recommended to use the AWS Config service-linked role: `AWSServiceRoleForConfig`. Service-linked roles are predefined and include all the permissions that AWS Config requires to call other AWS services. The AWS Config service-linked role is required for service-linked configuration recorders.
> For more information, see Using Service-Linked Roles for AWS Config.

Using the IAM console

You can use the IAM console to create an IAM role that grants AWS Config permissions to access your Amazon S3 bucket, access your Amazon SNS topic, and get configuration details for supported AWS resources. When you use the console to create an IAM role, AWS Config automatically attaches the required permissions to the role for you.

> **Note**
>
> If you have used an AWS service that uses AWS Config (such as AWS Security Hub or AWS Control Tower) and an AWS Config role has already been created, you should make sure that the IAM role you use when setting up AWS Config keeps the same minimum privileges as the already created AWS Config role in order for the other AWS service to continue to run as expected.
>
> For example, if AWS Control Tower has an IAM role that allows AWS Config to read Amazon S3 objects, you should guarantee the same permissions are granted within the IAM role you use when setting up AWS Config. Otherwise, it may interfere with AWS Control Tower's operations.
>
> For more information about IAM roles for AWS Config, see AWS Identity and Access Management.

To create a role for an AWS service

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane of the IAM console, choose **Roles**, and then choose **Create role**.
3. For **Select trusted entity**, choose **AWS service**.
4. Choose the use case you want for AWS Config: **Config - Customizable**, **Config - Organizations**, **Config**, or **Config - Conformance Packs**. Then, choose **Next**.
5. On the **Name, review, and create** page, review the details about your role, and choose **Create Role**.

Using the AWS SDKs

To use an AWS SDK, you must configure it with your credentials. For more information, see The shared config and credentials files in the *AWS SDKs and Tools Reference Guide*.

The following code examples show how to use `CreateRole`.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// Create a new IAM role.
    /// </summary>
    /// <param name="roleName">The name of the IAM role.</param>
    /// <param name="rolePolicyDocument">The name of the IAM policy document
    /// for the new role.</param>
    /// <returns>The Amazon Resource Name (ARN) of the role.</returns>
    public async Task<string> CreateRoleAsync(string roleName, string
rolePolicyDocument)
    {
        var request = new CreateRoleRequest
        {
            RoleName = roleName,
            AssumeRolePolicyDocument = rolePolicyDocument,
        };

        var response = await _IAMService.CreateRoleAsync(request);
        return response.Role.Arn;
    }
```

- For API details, see CreateRole in *AWS SDK for .NET API Reference*.

Bash

AWS CLI with Bash script

```

- For API details, see CreateRole in *AWS CLI Command Reference*.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::IAM::createIamRole(
        const Aws::String &roleName,
        const Aws::String &policy,
        const Aws::Client::ClientConfiguration &clientConfig) {
    Aws::IAM::IAMClient client(clientConfig);
    Aws::IAM::Model::CreateRoleRequest request;

    request.SetRoleName(roleName);
    request.SetAssumeRolePolicyDocument(policy);

    Aws::IAM::Model::CreateRoleOutcome outcome = client.CreateRole(request);
    if (!outcome.IsSuccess()) {
        std::cerr << "Error creating role. " <<
                  outcome.GetError().GetMessage() << std::endl;
    }
    else {
        const Aws::IAM::Model::Role iamRole = outcome.GetResult().GetRole();
        std::cout << "Created role " << iamRole.GetRoleName() << "\n";
        std::cout << "ID: " << iamRole.GetRoleId() << "\n";
```

```
        std::cout << "ARN: " << iamRole.GetArn() << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see CreateRole in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

Example 1: To create an IAM role

The following `create-role` example creates a role named `Test-Role` and attaches a trust policy to it.

```
aws iam create-role \
    --role-name Test-Role \
    --assume-role-policy-document file://Test-Role-Trust-Policy.json
```

Contents of `Test-Role-Trust-Policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "Statement1",
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:root"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

Output:

```
{
```

```
    "Role": {
        "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
        "RoleId": "AKIAIOSFODNN7EXAMPLE",
        "CreateDate": "2013-06-07T20:43:32.821Z",
        "RoleName": "Test-Role",
        "Path": "/",
        "Arn": "arn:aws:iam::123456789012:role/Test-Role"
    }
}
```

The trust policy is defined as a JSON document in the *Test-Role-Trust-Policy.json* file. (The file name and extension do not have significance.) The trust policy must specify a principal.

To attach a permissions policy to a role, use the `put-role-policy` command.

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

Example 2: To create an IAM role with specified maximum session duration

The following `create-role` example creates a role named `Test-Role` and sets a maximum session duration of 7200 seconds (2 hours).

```
aws iam create-role \
    --role-name Test-Role \
    --assume-role-policy-document file://Test-Role-Trust-Policy.json \
    --max-session-duration 7200
```

Contents of `Test-Role-Trust-Policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "Statement1",
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:root"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

Output:

```
{
    "Role": {
        "Path": "/",
        "RoleName": "Test-Role",
        "RoleId": "AKIAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:role/Test-Role",
        "CreateDate": "2023-05-24T23:50:25+00:00",
        "AssumeRolePolicyDocument": {
            "Version":"2012-10-17",
            "Statement": [
                {
                    "Sid": "Statement1",
                    "Effect": "Allow",
                    "Principal": {
                        "AWS": "arn:aws:iam::123456789012:root"
                    },
                    "Action": "sts:AssumeRole"
                }
            ]
        }
    }
}
```

For more information, see Modifying a role maximum session duration (AWS API) in the *AWS IAM User Guide*.

Example 3: To create an IAM Role with tags

The following `create-role` example creates an IAM role `Test-Role` with tags. This example uses the `--tags` parameter flag with the following JSON-formatted tags: `'{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'`. Alternatively, the `--tags` flag can be used with tags in the shorthand format: `'Key=Department,Value=Accounting Key=Location,Value=Seattle'`.

```
aws iam create-role \
    --role-name Test-Role \
    --assume-role-policy-document file://Test-Role-Trust-Policy.json \
    --tags '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location",
 "Value": "Seattle"}'
```

Contents of `Test-Role-Trust-Policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "Statement1",
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:root"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

Output:

```
{
    "Role": {
        "Path": "/",
        "RoleName": "Test-Role",
        "RoleId": "AKIAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:role/Test-Role",
        "CreateDate": "2023-05-25T23:29:41+00:00",
        "AssumeRolePolicyDocument": {
            "Version":"2012-10-17",
            "Statement": [
                {
                    "Sid": "Statement1",
                    "Effect": "Allow",
                    "Principal": {
                        "AWS": "arn:aws:iam::123456789012:root"
                    },
                    "Action": "sts:AssumeRole"
                }
            ]
        },
        "Tags": [
            {
                "Key": "Department",
                "Value": "Accounting"
            },
```

```
            {
                "Key": "Location",
                "Value": "Seattle"
            }
        ]
    }
}
```

For more information, see Tagging IAM roles in the *AWS IAM User Guide*.

            return $this->iamClient->createRole([
                'AssumeRolePolicyDocument' => $rolePolicyDocument,
                'RoleName' => $roleName,
            ]);
        });
        return $result['Role'];
    }
```

- For API details, see CreateRole in *AWS SDK for PHP API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates a new role named `MyNewRole` and attaches to it the policy found in the file `NewRoleTrustPolicy.json`. Note that you must use the `-Raw` switch parameter to successfully process the JSON policy file. The policy document displayed in the output is URL encoded. It is decoded in this example with the `UrlDecode` .NET method.

```
$results = New-IAMRole -AssumeRolePolicyDocument (Get-Content -raw
 NewRoleTrustPolicy.json) -RoleName MyNewRole
$results
```

Output:

```
Arn                      : arn:aws:iam::123456789012:role/MyNewRole
AssumeRolePolicyDocument : %7B%0D%0A%20%20%22Version%22%3A%20%222012-10-17%22%2C

  "Statement": [
    {
      "Sid": "",
      "Effect": "Allow",
      "Principal": {
        "AWS": "arn:aws:iam::123456789012:David"
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```

- For API details, see CreateRole in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates a new role named `MyNewRole` and attaches to it the policy found in the file `NewRoleTrustPolicy.json`. Note that you must use the `-Raw` switch parameter to successfully process the JSON policy file. The policy document displayed in the output is URL encoded. It is decoded in this example with the `UrlDecode` .NET method.

```
$results = New-IAMRole -AssumeRolePolicyDocument (Get-Content -raw
 NewRoleTrustPolicy.json) -RoleName MyNewRole
$results
```

Output:

```
Arn                       : arn:aws:iam::123456789012:role/MyNewRole
AssumeRolePolicyDocument  : %7B%0D%0A%20%20%22Version%22%3A%20%222012-10-17%22%2C
%0D%0A%20%20%22Statement%22
```

```

            throw error
        }
    }
```

- For API details, see CreateRole in *AWS SDK for Swift API reference*.

Starting AWS Config with a customer managed configuration recorder using the AWS CLI

You can start AWS Config by creating a customer managed configuration recorder. To create a customer managed configuration recorder with the AWS CLI, use the following commands: `put-configuration-recorder`, `put-delivery-channel`, and `start-configuration-recorder`.

- The `put-configuration-recorder` command creates a customer managed configuration recorder.
- The `put-delivery-channel` command creates a delivery channel where AWS Config delivers configuration information to an S3 bucket and SNS topic.
- The `start-configuration-recorder` starts the customer managed configuration recorder. The customer managed configuration recorder will begin recording configuration changes for the resource types you specify.

Topics

- Considerations
- Step 1: Run the put-configuration-recorder
- Step 2: Run the put-delivery-channel command
- Step 3: Run the start-configuration-recorder command

Considerations

S3 bucket, SNS topic, and IAM role are required

To create a customer managed configuration recorder, you need to create an S3 bucket, an SNS topic, and an IAM role with attached policies as prerequisites. To set up your prerequisites for AWS Config, see Prerequisites.

One customer managed configuration recorder per account per Region

You can have only one customer managed configuration recorder for each AWS account for each AWS Region.

One delivery channel per account per Region

You can have only one delivery channel region for each AWS account for each AWS Region.

Policies and compliance results

IAM policies and other policies managed in AWS Organizations can impact whether AWS Config has permissions to record configuration changes for your resources. Additionally, rules directly evaluate the configuration of a resource and rules don't take into account these policies when running evaluations. Make sure that the policies in effect align with how you intend to use AWS Config.

Step 1: Run the put-configuration-recorder

Use the `put-configuration-recorder` command to create a customer managed configuration recorder:

This command uses the `--configuration-recorder` and `---recording-group` fields.

```
$ aws configservice put-configuration-recorder \
--configuration-recorder file://configurationRecorder.json \
```

```
--recording-group file://recordingGroup.json
```

The `configuration-recorder` field

The `configurationRecorder.json` file specifies `name` and `roleArn` as well as the default recording frequency for the configuration recorder (`recordingMode`). You can also use this field to override the recording frequency for specific resource types.

```
{
  "name": "default",
  "roleARN": "arn:aws:iam::123456789012:role/config-role",
  "recordingMode": {
    "recordingFrequency": CONTINUOUS or DAILY,
    "recordingModeOverrides": [
        {
            "description": "Description you provide for the override",
            "recordingFrequency": CONTINUOUS or DAILY,
            "resourceTypes": [ Comma-separated list of resource types to include in the
 override ]
        }
    ]
  }
}
```

The `recording-group` field

The `recordingGroup.json` file specifies which resource types are recorded.

```
{
    "allSupported": boolean,
    "exclusionByResourceTypes": {
        "resourceTypes": [ Comma-separated list of resource types to exclude ]
    },
    "includeGlobalResourceTypes": boolean,
    "recordingStrategy": {
        "useOnly": "Recording strategy for the configuration recorder"
    },
    "resourceTypes": [ Comma-separated list of resource types to include]
}
```

For more information about these fields, see `put-configuration-recorder` in the *AWS CLI Command Reference*.

Step 2: Run the put-delivery-channel command

Use the `put-delivery-channel` command to create a delivery channel:

This command uses the `--delivery-channel` field.

```
$ aws configservice put-delivery-channel --delivery-channel file://deliveryChannel.json
```

The `delivery-channel` field

The `deliveryChannel.json` file specifies the following:

- The `name` for the delivery channel.
- The `s3BucketName` where AWS Config sends configuration snapshots.
- The `snsTopicARN` where AWS Config sends notifications
- The `configSnapshotDeliveryProperties` which sets how often AWS Config delivers configuration snapshots and how often it invokes evaluations for periodic rules.

```
{
    "name": "default",
    "s3BucketName": "config-bucket-123456789012",
    "snsTopicARN": "arn:aws:sns:us-east-1:123456789012:config-topic",
    "configSnapshotDeliveryProperties": {
        "deliveryFrequency": "Twelve_Hours"
    }
}
```

For more information about these fields, see `put-delivery-channel` in the *AWS CLI Command Reference*.

Step 3: Run the start-configuration-recorder command

Use the `start-configuration-recorder` command to start AWS Config:

```
$ aws configservice start-configuration-recorder --configuration-recorder-
name configRecorderName
```

For more information about these fields, see `start-configuration-recorder` in the *AWS CLI Command Reference*.

Verifying that AWS Config is Successfully Started with the AWS CLI

After you have started AWS Config, you can use AWS CLI commands to check that the AWS Config is running and that AWS Config has created a configuration recorder and a delivery channel. You can also confirm that AWS Config has started recording and delivering configurations to the delivery channel.

Topics

- Step 1: Check that a delivery channel is Created
- Step 2: Check that a configuration recorder is Created
- Step 3: Check that AWS Config has started recording

Step 1: Check that a delivery channel is Created

Use the `describe-delivery-channels` command to check that your Amazon S3 bucket and Amazon SNS topic is configured.

You can use the `--delivery-channel-names` field to specify a list of delivery channel. If a delivery channel is not specified, this command returns the details of all delivery channels associated with the account.

```
$ aws configservice describe-delivery-channels
{
    "DeliveryChannels": [
        {
            "snsTopicARN": "arn:aws:sns:us-west-2:0123456789012:my-config-topic",
            "name": "my-delivery-channel",
            "s3BucketName": "my-config-bucket"
        }
    ]
}
```

Step 2: Check that a configuration recorder is Created

Use the `describe-configuration-recorders` command to check that a configuration recorder is created.

You can use the `arn` and `configuration-recorder-names` fields to specify a list of configuration recorders. If a configuration recorder is not specified, this command returns the details of all configuration recorders associated with the account.

```
$ aws configservice describe-configuration-recorders
{
    "ConfigurationRecorders": [
        {
            "roleARN": "arn:aws:iam::012345678912:role/myConfigRole",
            "name": "default"
        }
    ]
}
```

Step 3: Check that AWS Config has started recording

Use the `describe-configuration-recorder-status` command to check that the configuration recorder is successfully recording the resource types in scope.

You can use the `arn` and `configuration-recorder-names` fields to specify a list of configuration recorders. If a configuration recorder is not specified, this command returns the details of all configuration recorders associated with the account.

```
$ aws configservice describe-configuration-recorder-status
{
    "ConfigurationRecordersStatus": [
        {
            "name": "default",
            "lastStatus": "SUCCESS",
            "lastStopTime": 1414511624.914,
            "lastStartTime": 1414708460.276,
            "recording": true,
            "lastStatusChangeTime": 1414816537.148,
            "lastErrorMessage": "NA",
            "lastErrorCode": "400"
        }
    ]
}
```

The `true` value in the `recording` field confirms that the configuration recorder has started recording configurations. AWS Config records the time in UTC. The output is displayed as a Unix timestamp.

Using AWS Config with an AWS SDK

AWS software development kits (SDKs) are available for many popular programming languages. Each SDK provides an API, code examples, and documentation that make it easier for developers to build applications in their preferred language.

SDK documentation	Code examples
AWS SDK for C++	AWS SDK for C++ code examples
AWS CLI	AWS CLI code examples
AWS SDK for Go	AWS SDK for Go code examples
AWS SDK for Java	AWS SDK for Java code examples
AWS SDK for JavaScript	AWS SDK for JavaScript code examples
AWS SDK for Kotlin	AWS SDK for Kotlin code examples
AWS SDK for .NET	AWS SDK for .NET code examples
AWS SDK for PHP	AWS SDK for PHP code examples
AWS Tools for PowerShell	AWS Tools for PowerShell code examples
AWS SDK for Python v4	AWS SDK for Python v4 code examples
AWS SDK for Python (Boto3)	AWS SDK for Python (Boto3) code examples
AWS SDK for Ruby	AWS SDK for Ruby code examples
AWS SDK for Rust	AWS SDK for Rust code examples
AWS SDK for SAP ABAP	AWS SDK for SAP ABAP code examples
AWS SDK for Swift	AWS SDK for Swift code examples

For examples specific to AWS Config, see Code examples for AWS Config using AWS SDKs.

Example availability

Working with the configuration recorder

The *configuration recorder* stores the configuration changes to the resource types in scope as configuration items (CIs).

There are two types of configuration recorders.

Type	Description
Customer managed configuration recorder	A configuration recorder that you managed. The resource types in scope are set by you. By default, a customer managed configuration recorder records all supported resources in the AWS Region where AWS Config is running.
Service-linked configuration recorder	A configuration recorder that is linked to a specific AWS service. The resource types in scope are set by the linked service.

Topics

- Considerations for the customer managed configuration recorder
- Considerations for service-linked configuration recorders
- Drift detection for the configuration recorder
- Starting the customer managed configuration recorder
- Stopping the customer managed configuration recorder
- Changing the recording frequency for the customer managed configuration recorder
- Renaming the customer managed configuration recorder
- Viewing your configuration recorders
- Deleting your configuration recorders

Considerations for the customer managed configuration recorder

One customer managed configuration recorder per account per Region

You can have only one customer managed configuration recorder for each AWS account for each AWS Region.

Default is to record all supported resource types, excluding the global IAM resource types

The default for a customer managed configuration recorder is to record all supported resource types, excluding the following global IAM resource types: `AWS::IAM::Group`, `AWS::IAM::Policy`, `AWS::IAM::Role`, and `AWS::IAM::User` You can specify which resource types you want to include or exclude from recording.

For more information, see Recording AWS Resources with AWS Config.

You are charged service usage fees for using the customer managed configuration recorder

You are charged service usage fees when AWS Config starts recording configurations with the customer managed configuration recorder.

For pricing information, see AWS Config Pricing.

Use AWS Systems Manager to create a customer managed configuration recorder across an organization

You can use AWS Systems Manager Quick Setup to create a customer managed configuration recorder across multiple organizational units (OUs) and AWS Regions using AWS best practices.

For more information, see Create an AWS Config configuration recorder using Quick Setup in the *Systems Manager User Guide*.

> **Important**
>
> **Policies and compliance results**
>
> IAM policies and other policies managed in AWS Organizations can impact whether AWS Config has permissions to record configuration changes for your resources. Additionally,

rules directly evaluate the configuration of a resource and rules don't take into account these policies when running evaluations. Make sure that the policies in effect align with how you intend to use AWS Config.

Stale evaluation results for deleted resources can persist if the configuration recorder is turned off

If the customer managed configuration recorder is turned off, it disables the ability of AWS Config Config to track changes to the configuration of the resources you specified, including their deletions. This means you might see stale evaluation results for resources that are deleted when the customer managed configuration recorder is turned off since AWS Config cannot capture deletion events if recording is not on.

Considerations for service-linked configuration recorders

The AWS Config service-linked role must be used

The AWS Config service-linked role is required for service-linked configuration recorders.

For more information, see Using Service-Linked Roles for AWS Config.

Service-linked configuration recorders are always recording

Service-linked recorders are fixed. You can't directly change the settings in a service-linked recorder. To modify recorder settings such as starting, stopping, or updating the recorder, make these changes through the associated AWS service that uses the service-linked recorder.

For more information, see Deleting the Configuration Recorder.

The recording scope determines if you receive configuration items

The recording scope is set by the AWS service that is linked to the configuration recorder and determines whether you receive configuration items (CIs) in the delivery channel. If the recording scope is INTERNAL, you will not receive CIs in the delivery channel.

The recording scope determines if you are charged a service fee

The recording scope is set by the AWS service that is linked to the configuration recorder and determines whether the configuration items (CIs) in scope are recorded for free (INTERNAL) or if it impacts the costs of your bill (PAID).

Recording frequency precedence between recorders

When you have both a customer managed configuration recorder and a service-linked configuration recorder with a recording scope of 'PAID' that record the same resource types, the recorder with the higher recording frequency takes precedence. For example, if your customer managed recorder is set to daily recording, but you enable an AWS service that uses a service-linked recorder with a recording scope of 'PAID' and continuous recording, the affected resource types will be recorded continuously.

This means that even though your customer managed recorder settings still show "Daily recording," you will be charged for continuous recording for the resource types that are in scope for both recorders. This only affects resource types that are being recorded by both recorders.

> **Note**
>
> You are charged only once per configuration item, regardless of the number of configuration items generated by a customer managed configuration recorder or service-linked configuration recorders that you pay for.

Example: Recording frequency precedence

You have configured your customer managed recorder to record Amazon EC2 instances with daily recording frequency. Later, you enable an AWS service feature that uses a service-linked recorder with a recording scope of 'PAID' and continuous recording that also records Amazon EC2 instances. In this scenario:

- Your customer managed recorder settings will still show "Daily recording"
- Amazon EC2 instances will be recorded continuously and provides additional CIs because the service-linked recorder with a recording scope of 'PAID' has a higher recording frequency
- You will be charged for continuous recording of Amazon EC2 instances
- Other resource types that are only recorded by your customer managed recorder will continue to be recorded in a daily recording frequency

Supported services

Service-linked configuration recorders are supported for the following services:

AWS service	Service principal	Recorder name	Benefits of using with AWS Config	Learn more
Amazon CloudWatch	`observabilityadmin.amazonaws.com`, `telemetry-enablement.observabilityadmin.amazonaws.com`	`AWSConfigurationRecorderForObservabilityAdmin`, `AWSConfigurationRecorderForObservabilityAdmin_TelemetryEnablement`	You can use Amazon CloudWatch Observability Admin to discover and understand the state of telemetry configuration in CloudWatch for your AWS Organization or account.	For more information, see Auditing CloudWatch telemetry configurations in the *CloudWatch User Guide*.
AWS Security Hub	`securityhubv2.amazonaws.com`	`AWSConfigurationRecorderForSecurityHubAssets`, `AWSConfigurationRecorderForSecurityHubAssetsGlobal`	You can use AWS Security Hub to generate security findings and perform security assessments across your AWS accounts. The service-linked recorder enables the collection of resource configuration items required for asset visibility and analysis across regional and global resource types.	For more information, see Enabling Security Hub in the *Security Hub and Security Hub CSPM User Guide*.
AWS Security Hub CSPM	`securityhub.amazonaws.com`	`AWSConfigurationRecorderForSecurityHubCSPM`	You can use AWS Security Hub CSPM to generate security findings and perform assessments across your AWS accounts. The service-linked	For more information, see Enabling Security Hub CSPM in the

AWS service	Service principal	Recorder name	Benefits of using with AWS Config	Learn more
			recorder enables the collectio n of resource configuration items required to support these evaluations.	*Security Hub and Security Hub CSPM User Guide*.

Drift detection for the configuration recorder

The `AWS::Config::ConfigurationRecorder` resource type is a *configuration item* (CI) for the configuration recorder that tracks all changes to the state of configuration recorder. You can use this CI to check if the state of the configuration recorder differs, or has *drifted*, from its previous state.

For example, this CI tracks if there are updates to resource types that you have enabled AWS Config to track, if you have stopped or started the configuration recorder, or if you have deleted or uninstalled the configuration recorder. A drifted configuration recorder indicates that you are not accurately detecting changes to your intended resource types. If your configuration recorder has been drifted, this can result in false negative or false positive compliance results.

The `AWS::Config::ConfigurationRecorder` resource type is a system resource type of AWS Config and recording of this resource type is enabled by default in all supported Regions. Recording for the `AWS::Config::ConfigurationRecorder` resource type comes with no additional charge.

Starting the customer managed configuration recorder

You can use the AWS Config console or the AWS CLI start the customer managed configuration recorder.

To start the customer managed configuration recorder (Console)

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Choose **Settings** in the navigation pane.

3. On the **Customer managed recorder** tab, choose **Start recording**. When prompted, choose **Confirm**.

To start the customer managed configuration recorder (CLI)

Use the `start-configuration-recorder` command:

```
$ aws configservice start-configuration-recorder --configuration-recorder-
name configRecorderName
```

Stopping the customer managed configuration recorder

> **Note**
>
> **Service-linked configuration recorders are always recording**
> You cannot stop a service-linked configuration recorder because service-linked configuration recorders are always recording. To stop recording, you must delete the service-linked configuration recorder. For more information, see Deleting the Configuration Recorder.

You can use the AWS Config console or the AWS CLI stop the customer managed configuration recorder.

To stop the customer managed configuration recorder (Console)

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Choose **Settings** in the navigation pane.
3. On the **Customer managed recorder** tab, choose **Stop recording**. When prompted, choose **Confirm**.

To stop the customer managed configuration recorder (CLI)

Use the `stop-configuration-recorder` command:

```
$ aws configservice stop-configuration-recorder --configuration-recorder-
name configRecorderName
```

Changing the recording frequency for the customer managed configuration recorder

AWS Config supports continuous recording and daily recording:

- *Continuous recording* allows you to record configuration changes continuously whenever a change occurs.
- *Daily recording* allows you to receive a configuration item (CI) representing the most recent state of your resources over the last 24-hour period, only if it's different from the previous CI recorded. For more information see, Recording Frequency.

You can use the AWS Config console or the AWS CLI change the recording frequency.

To change the recording frequency for the customer managed configuration recorder (Console)

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Choose **Settings** in the navigation pane.
3. On the **Customer managed recorder** tab, choose **Start recording**.
4. For **Recording method managed recorder**, choose **All resource types with customizable overrides**.
5. For **Default settings**, choose a recording frequency.
6. Choose **Save**.

To change the recording frequency (CLI)

Use the `put-configuration-recorder` command to change the recording frequency for the configuration recorder:

```
$ aws configservice put-configuration-recorder \
--configuration-recorder file://configurationRecorder.json
```

The `configurationRecorder.json` file specifies `name` and `roleArn` as well as the default recording frequency for the configuration recorder (`recordingMode`). You can also use this field override the recording frequency for specific resource types.

```
{
  "name": "default",
  "roleARN": "arn:aws:iam::123456789012:role/config-role",
  "recordingMode": {
    "recordingFrequency": CONTINUOUS or DAILY,
    "recordingModeOverrides": [
        {
            "description": "Description you provide for the override",
            "recordingFrequency": CONTINUOUS or DAILY,
            "resourceTypes": [ Comma-separated list of resource types to include in
 the override ]
        }
    ]
  }
}
```

`put-configuration-recorder` uses the following fields for the `--configuration-recorder` parameter:

- `name` – The name of the configuration recorder. AWS Config automatically assigns the name of "default" when creating the configuration recorder.
- `roleARN` – Amazon Resource Name (ARN) of the IAM role assumed by AWS Config and used by the configuration recorder.
- `recordingMode` – Specifies the default recording frequency that AWS Config uses to record configuration changes. AWS Config supports *Continuous recording* and *Daily recording*. Continuous recording allows you to record configuration changes continuously whenever a change occurs. Daily recording allows you to receive a configuration item (CI) representing the most recent state of your resources over the last 24-hour period, only if it's different from the previous CI recorded.
  - `recordingFrequency` – The default recording frequency that AWS Config uses to record configuration changes.

> **Note**
>
> AWS Firewall Manager depends on continuous recording to monitor your resources. If you are using Firewall Manager, it is recommended that you set the recording frequency to Continuous.

- `recordingModeOverrides` – This field allows you to specify your overrides for the recording mode. It is an array of `recordingModeOverride` objects. Each `recordingModeOverride` object in the `recordingModeOverrides` array consists of three fields:
  - `description` – A description that you provide for the override.
  - `recordingFrequency` – The recording frequency that will be applied to all the resource types specified in the override.
  - `resourceTypes` – A comma-separated list that specifies which resource types AWS Config includes in the override.

> **Note**
>
> **Required and optional fields**
>
> The `recordingMode` field for `put-configuration-recorder` is optional. By default, the recording frequency for the configuration recorder is set to Continuous recording.

> **Note**
>
> **Limits**
>
> Daily recording is not supported for the following resource types:
>
> - `AWS::Config::ResourceCompliance`
> - `AWS::Config::ConformancePackCompliance`
> - `AWS::Config::ConfigurationRecorder`

For the **Record all current and future supported resource types** (ALL_SUPPORTED_RESOURCE_TYPES) recording strategy, these resource types will be set to Continuous recording.

Renaming the customer managed configuration recorder

You must use the AWS CLI to rename the customer managed configuration recorder. To change the name of the customer managed configuration recorder, you must delete it and create a new configuration recorder with your specified name.

Renaming the customer managed configuration recorder using the AWS CLI

1. Use the describe-configuration-recorders command to look up the name of your current customer managed configuration recorder:

```
$ aws configservice describe-configuration-recorders
{
    "ConfigurationRecorders": [
        {
            "roleARN": "arn:aws:iam::012345678912:role/myConfigRole",
            "name": "default"
        }
    ]
}
```

2. Use the delete-configuration-recorder command to delete your customer managed current configuration recorder:

```
$ aws configservice delete-configuration-recorder --configuration-recorder-
name default
```

3. Use the put-configuration-recorder command to create a customer managed configuration recorder with the new name:

```
$ aws configservice put-configuration-recorder --configuration-recorder
 name=configRecorderName,roleARN=arn:aws:iam::012345678912:role/myConfigRole
```

4. Use the start-configuration-recorder command to resume recording:

```
$ aws configservice start-configuration-recorder --configuration-recorder-
name configRecorderName
```

Viewing your configuration recorders

You can use the AWS Config console or the AWS CLI view details about your configuration recorders.

To view your configuration recorders (Console)

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Choose **Settings** in the navigation pane.
3. For the customer managed configuration recorder, you can view details on the **Customer managed recorder** tab.
4. For service-linked configuration recorders, choose a service-linked configuration recorders on the **Service-linked recorders** tab, and then choose **View**.

To view your configuration recorders (CLI)

Use the `describe-configuration-recorders` command to view details about your configuration recorders:

```
$ aws configservice describe-configuration-recorders
{
    "ConfigurationRecorders": [
        {
            "roleARN": "arn:aws:iam::012345678912:role/myConfigRole",
            "name": "default"
        }
    ]
}
```

Use the `describe-configuration-recorder-status` command to view the current status of your configuration recorders:

```
$ aws configservice describe-configuration-recorder-status
```

```
{
    "ConfigurationRecordersStatus": [
        {
            "name": "default",
            "lastStatus": "SUCCESS",
            "lastStopTime": 1414511624.914,
            "lastStartTime": 1414708460.276,
            "recording": true,
            "lastStatusChangeTime": 1414816537.148,
            "lastErrorMessage": "NA",
            "lastErrorCode": "400"
        }
    ]
}
```

For both of these commands, you can use the `arn` and `configuration-recorder-names` fields to specify a list of configuration recorders. For service-linked configuration recorders, you can use the `service-principal` field to specify a configuration recorder.

If a configuration recorder is not specified, this command returns the details of all configuration recorders associated with the account.

Deleting your configuration recorders

You must use the AWS CLI to delete the customer managed configuration recorder. You can use AWS Config console or the AWS CLI to delete a service-linked configuration recorder.

To delete the customer managed configuration recorder (CLI)

Use the `delete-configuration-recorder` command:

```
$ aws configservice delete-configuration-recorder --configuration-recorder-
name default
```

To delete a service-linked configuration recorder (Console)

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Choose **Settings** in the navigation pane.

3. On the **Service-linked recorders** tab, choose a service-linked configuration recorders on the **Service-linked recorders** tab, and then choose **Delete**. When prompted, choose **Delete**.

To delete a service-linked configuration recorder (CLI)

Use the `delete-service-linked-configuration-recorder` command:

This command uses the `--service-principal` field.

```
$ aws configservice delete-service-linked-configuration-recorder --service-principal
 "The service principal of the AWS service for the service-linked configuration
 recorder that you want to delete"
```

Working with the Delivery Channel

As AWS Config continually records the changes that occur to your AWS resources, it sends notifications and updated configuration states through the *delivery channel*. You can manage the delivery channel to control where AWS Config sends configuration updates.

Topics

- Considerations
- Terminology
- Components of a Configuration Item
- Viewing the Delivery Channel
- Updating the Delivery Channel
- Renaming the Delivery Channel
- Delivering Configuration Snapshots to an Amazon S3 Bucket
- Verifying Delivery Status
- Viewing Configuration Snapshots in Amazon S3 bucket
- Example Configuration Snapshot from AWS Config
- Notifications that AWS Config Sends to an Amazon SNS topic

Considerations

One delivery channel per Region per account

You can have only one delivery channel per AWS Region region per AWS account, and the delivery channel is required to use AWS Config.

Oversized configuration item notifications include a brief summary

When AWS Config detects a configuration change for a resource and the notification exceeds the maximum size allowed by Amazon SNS, the notification includes a brief summary of the configuration item. You can view the complete notification in the Amazon S3 bucket location specified in the `s3BucketLocation` field. For more information, see Example Oversized Configuration Item Change Notification.

AWS Config supports AWS KMS encryption for Amazon S3 buckets used by AWS Config

You can provide an AWS Key Management Service (AWS KMS) key or alias Amazon Resource Name (ARN) to encrypt the data delivered to your Amazon Simple Storage Service (Amazon S3) bucket. By default, AWS Config delivers configuration history and snapshot files to your Amazon S3 bucket and encrypts the data at rest using S3 AES-256 server-side encryption, SSE-S3. However, if you provide AWS Config with your KMS key or alias ARN, AWS Config uses that KMS key instead of AES-256 encryption.

AWS Config does not support the delivery channel to an Amazon S3 bucket where object lock is enabled with default retention enabled. For more information, see How S3 Object Lock works.

Terminology

A *configuration item* represents a point-in-time view of the various attributes of a supported AWS resource that exists in your account. The components of a configuration item include metadata, attributes, relationships, current configuration, and related events. AWS Config creates a configuration item whenever it detects a change to a resource type that it is recording. For example, if AWS Config is recording Amazon S3 buckets, AWS Config creates a configuration item whenever a bucket is created, updated, or deleted. You can also select for AWS Config to create a configuration item at the recording frequency that you set.

A *configuration history* is a collection of the configuration items for a given resource over any time period. A configuration history can help you answer questions about, for example, when the resource was first created, how the resource has been configured over the last month, and what configuration changes were introduced yesterday at 9 AM. The configuration history is available to you in multiple formats. AWS Config automatically delivers a configuration history file for each resource type that is being recorded to an Amazon S3 bucket that you specify. You can select a given resource in the AWS Config console and navigate to all previous configuration items for that resource using the timeline. Additionally, you can access the historical configuration items for a resource from the API.

A *configuration snapshot* is a collection of the configuration items for the supported resources that exist in your account. This configuration snapshot is a complete picture of the resources that are being recorded and their configurations. The configuration snapshot can be a useful tool for validating your configuration. For example, you may want to examine the configuration snapshot regularly for resources that are configured incorrectly or that potentially should not exist. The configuration snapshot is available in multiple formats. You can have the configuration snapshot delivered to an Amazon Simple Storage Service (Amazon S3) bucket that you specify. Additionally,

you can select a point in time in the AWS Config console and navigate through the snapshot of configuration items using the relationships between the resources.

A *configuration stream* is an automatically updated list of all configuration items for the resources that AWS Config is recording. Every time a resource is created, modified, or deleted, AWS Config creates a configuration item and adds to the configuration stream. The configuration stream works by using an Amazon Simple Notification Service (Amazon SNS) topic of your choice. The configuration stream is helpful for observing configuration changes as they occur so that you can spot potential problems, generating notifications if certain resources are changed, or updating external systems that need to reflect the configuration of your AWS resources.

Components of a Configuration Item

A *configuration item* represents a point-in-time view of the various attributes of a supported AWS resource that exists in your account. The components of a configuration item include metadata, attributes, relationships, current configuration, and related events. AWS Config creates a configuration item whenever it detects a change to a resource type that it is recording. For example, if AWS Config is recording Amazon S3 buckets, AWS Config creates a configuration item whenever a bucket is created, updated, or deleted. You can also select for AWS Config to create a configuration item at the recording frequency that you set.

A configuration item consists of the following components.

Component	Description	Contains
Metadata	Information about this configuration item	• Version ID • Time when the configuration item was captured • Status of the configuration item indicatin g whether the item was captured successfully • State ID indicating the ordering of the configuration items of a resource
Attributes	Resource attributes	• Resource ID • List of key–value tags for this resource

Component	Description	Contains
		• Resource type (see Supported Resource Types for AWS Config) • Amazon Resource Name (ARN) • Availability Zone that contains this resource, if applicable • Time the resource was created
Relationships	How the resource is related to other resources associated with the account	Description of the relationship, such as Amazon EBS volume `vol-1234567` is attached to an Amazon EC2 instance `i-a1b2c3d4`
Current configuration	Information returned through a call to the Describe or List API of the resource	For example, `DescribeVolumes` API returns the following information about the volume: • Availability Zone the volume is in • Time the volume was attached • ID of the EC2 instance it is attached to • Current status of the volume • State of DeleteOnTermination flag • Device the volume is attached to • Type of volume, such as `gp2`, `io1`, or `standard`

Notes

1. A configuration item relationship does not include network flow or data flow dependencies. Configuration items cannot be customized to represent your application architecture.
2. As of Version 1.3, the relatedEvents field is empty. You can access the LookupEvents API in the *AWS CloudTrail API Reference* to retrieve the events for the resource.
3. As of Version 1.3, the configurationItemMD5Hash field is empty. You can use the configurationStateId field to ensure you have the latest configuration item.

4. If a resource type does not support tagging or does not include tag information in its describe API response, AWS Config won't capture tag data in the configuration items (CIs) for that resource type. AWS Config will still record these resources. However, any functionality that relies on tag data won't work. This affects tag-based filtering, grouping, or compliance evaluation that relies on tag data.

Viewing the Delivery Channel

You must use the AWS CLI to view details about the delivery channel.

The following code examples show how to use `DescribeDeliveryChannels`.

CLI

AWS CLI

To get details about the delivery channel

The following `describe-delivery-channels` example returns details about the delivery channel.

```
aws configservice describe-delivery-channels
```

Output:

```
{
    "DeliveryChannels": [
        {
            "snsTopicARN": "arn:aws:sns:us-west-2:123456789012:config-topic",
            "name": "default",
            "s3BucketName": "amzn-s3-demo-bucket"
        }
    ]
}
```

For more information, see Working with the Delivery Channel in the *AWS Config Developer Guide*.

- For API details, see DescribeDeliveryChannels in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example retrieves the delivery channel for the region and displays details.

```
Get-CFGDeliveryChannel -Region eu-west-1 | Select-Object Name, S3BucketName,
 S3KeyPrefix,
 @{N="DeliveryFrequency";E={$_.ConfigSnapshotDeliveryProperties.DeliveryFrequency}}
```

Output:

```
Name    S3BucketName               S3KeyPrefix DeliveryFrequency
----    ------------               ----------- -----------------
default config-bucket-NA my          TwentyFour_Hours
```

- For API details, see DescribeDeliveryChannels in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example retrieves the delivery channel for the region and displays details.

```
Get-CFGDeliveryChannel -Region eu-west-1 | Select-Object Name, S3BucketName,
 S3KeyPrefix,
 @{N="DeliveryFrequency";E={$_.ConfigSnapshotDeliveryProperties.DeliveryFrequency}}
```

Output:

```
Name    S3BucketName               S3KeyPrefix DeliveryFrequency
----    ------------               ----------- -----------------
default config-bucket-NA my          TwentyFour_Hours
```

- For API details, see DescribeDeliveryChannels in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Updating the Delivery Channel

When you update the delivery channel, you can set the following options:

- The Amazon S3 bucket where AWS Config sends configuration snapshots and configuration history files.
- How often AWS Config delivers configuration snapshots to your Amazon S3 bucket.
- The Amazon SNS topic to which AWS Config sends notifications about configuration changes.

To update the delivery channel (Console)

You can use the AWS Config console to set the Amazon S3 bucket and the Amazon SNS topic for your delivery channel. For steps to manage these settings, see Setting Up AWS Config with the Console.

The console does not provide options to rename the delivery channel, set the frequency for configuration snapshots, or delete the delivery channel. To do these tasks, you must use the AWS CLI, the AWS Config API, or one of the AWS SDKs.

To update the delivery channel (AWS SDKs)

The following code examples show how to use `PutDeliveryChannel`.

CLI

AWS CLI

To create a delivery channel

The following `put-delivery-channel` example provides the settings for the delivery channel as JSON code.

```
aws configservice put-delivery-channel \
    --delivery-channel file://deliveryChannel.json
```

The `deliveryChannel.json` file specifies the delivery channel attributes.

Contents of `deliveryChannel.json`:

```
{
    "name": "default",
    "s3BucketName": "amzn-s3-demo-bucket",
```

```
    "snsTopicARN": "arn:aws:sns:us-west-2:123456789012:config-topic",
    "configSnapshotDeliveryProperties": {
        "deliveryFrequency": "Twelve_Hours"
    }
}
```

This example sets the following attributes:

`name` - The name of the delivery channel. By default, AWS Config assigns the name `default` to a new delivery channel.You cannot update the delivery channel name with the `put-delivery-channel` command. For the steps to change the name, see Renaming the Delivery Channel.`s3BucketName` - The name of the Amazon S3 bucket to which AWS Config delivers configuration snapshots and configuration history files.If you specify a bucket that belongs to another AWS account, that bucket must have policies that grant access permissions to AWS Config. For more information, see Permissions for the Amazon S3 Bucket.

`snsTopicARN` - The Amazon Resource Name (ARN) of the Amazon SNS topic to which AWS Config sends notifications about configuration changes.If you choose a topic from another account, the topic must have policies that grant access permissions to AWS Config. For more information, see Permissions for the Amazon SNS Topic.

`configSnapshotDeliveryProperties` - Contains the `deliveryFrequency` attribute, which sets how often AWS Config delivers configuration snapshots and how often it invokes evaluations for periodic Config rules.

This command produces no output. To verify the settings of your delivery channel, run the describe-delivery-channels command.

For more information, see Working with the Delivery Channel in the *AWS Config Developer Guide*.

- For API details, see PutDeliveryChannel in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example changes the deliveryFrequency property of an existing delivery channel.

```
Write-CFGDeliveryChannel -ConfigSnapshotDeliveryProperties_DeliveryFrequency
 TwentyFour_Hours -DeliveryChannelName default -DeliveryChannel_S3BucketName
 amzn-s3-demo-bucket -DeliveryChannel_S3KeyPrefix my
```

- For API details, see PutDeliveryChannel in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example changes the deliveryFrequency property of an existing delivery channel.

```
Write-CFGDeliveryChannel -ConfigSnapshotDeliveryProperties_DeliveryFrequency
 TwentyFour_Hours -DeliveryChannelName default -DeliveryChannel_S3BucketName
 amzn-s3-demo-bucket -DeliveryChannel_S3KeyPrefix my
```

- For API details, see PutDeliveryChannel in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

(Optional) You can use the `describe-delivery-channels` command to verify that the delivery channel settings are updated:

```
$ aws configservice describe-delivery-channels
{
    "DeliveryChannels": [
        {
            "configSnapshotDeliveryProperties": {
                "deliveryFrequency": "Twelve_Hours"
            },
            "snsTopicARN": "arn:aws:sns:us-east-2:123456789012:config-topic",
            "name": "default",
            "s3BucketName": "config-bucket-123456789012"
        }
    ]
}
```

The following code examples show how to use `DescribeDeliveryChannels`.

CLI

AWS CLI

To get details about the delivery channel

The following `describe-delivery-channels` example returns details about the delivery channel.

```
aws configservice describe-delivery-channels
```

Output:

```
{
    "DeliveryChannels": [
        {
            "snsTopicARN": "arn:aws:sns:us-west-2:123456789012:config-topic",
            "name": "default",
            "s3BucketName": "amzn-s3-demo-bucket"
        }
    ]
}
```

For more information, see Working with the Delivery Channel in the *AWS Config Developer Guide*.

- For API details, see DescribeDeliveryChannels in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example retrieves the delivery channel for the region and displays details.

```
Get-CFGDeliveryChannel -Region eu-west-1 | Select-Object Name, S3BucketName,
 S3KeyPrefix,
 @{N="DeliveryFrequency";E={$_.ConfigSnapshotDeliveryProperties.DeliveryFrequency}}
```

Output:

```
Name    S3BucketName               S3KeyPrefix DeliveryFrequency
----    ------------               ----------- -----------------
default config-bucket-NA my          TwentyFour_Hours
```

- For API details, see DescribeDeliveryChannels in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example retrieves the delivery channel for the region and displays details.

```
Get-CFGDeliveryChannel -Region eu-west-1 | Select-Object Name, S3BucketName,
 S3KeyPrefix,
 @{N="DeliveryFrequency";E={$_.ConfigSnapshotDeliveryProperties.DeliveryFrequency}}
```

Output:

```
Name    S3BucketName               S3KeyPrefix DeliveryFrequency
----    ------------               ----------- -----------------
default config-bucket-NA my          TwentyFour_Hours
```

- For API details, see DescribeDeliveryChannels in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Renaming the Delivery Channel

To change the delivery channel name, you must delete it and create a new delivery channel with your specified name. Before you can delete the delivery channel, you must temporarily stop the configuration recorder. The AWS Config console does not provide the option to delete the delivery channel. You must use the AWS CLI, the AWS Config API, or one of the AWS SDKs.

Renaming the delivery channel using the AWS CLI

1. Use the `stop-configuration-recorder` command to stop the configuration recorder:

```
$ aws configservice stop-configuration-recorder --configuration-recorder-
name configRecorderName
```

2. Use the `describe-delivery-channels` command, and take note of your delivery channel's attributes:

```
$ aws configservice describe-delivery-channels
{
    "DeliveryChannels": [
        {
            "configSnapshotDeliveryProperties": {
```

```
                "deliveryFrequency": "Twelve_Hours"
            },
            "snsTopicARN": "arn:aws:sns:us-east-2:123456789012:config-topic",
            "name": "default",
            "s3BucketName": "config-bucket-123456789012"
        }
    ]
}
```

3. Use the `delete-delivery-channel` command to delete the delivery channel:

```
$ aws configservice delete-delivery-channel --delivery-channel-name default
```

4. Use the `put-delivery-channel` command to create a delivery channel with the desired name:

```
$ aws configservice put-delivery-channel --delivery-channel file://
deliveryChannel.json
```

The deliveryChannel.json file specifies the delivery channel attributes:

```
{
    "name": "myCustomDeliveryChannelName",
    "s3BucketName": "config-bucket-123456789012",
    "snsTopicARN": "arn:aws:sns:us-east-2:123456789012:config-topic",
    "configSnapshotDeliveryProperties": {
        "deliveryFrequency": "Twelve_Hours"
    }
}
```

5. Use the `start-configuration-recorder` command to resume recording:

```
$ aws configservice start-configuration-recorder --configuration-recorder-
name configRecorderName
```

Delivering Configuration Snapshots to an Amazon S3 Bucket

A *configuration snapshot* is a collection of the configuration items for the supported resources that exist in your account. This configuration snapshot is a complete picture of the resources that are being recorded and their configurations. The configuration snapshot can be a useful tool for

validating your configuration. For example, you may want to examine the configuration snapshot regularly for resources that are configured incorrectly or that potentially should not exist. The configuration snapshot is available in multiple formats. You can have the configuration snapshot delivered to an Amazon Simple Storage Service (Amazon S3) bucket that you specify. Additionally, you can select a point in time in the AWS Config console and navigate through the snapshot of configuration items using the relationships between the resources.

Delivering Configuration Snapshots

AWS Config generates configuration snapshots when you invoke the DeliverConfigSnapshot action or you run the AWS CLI `deliver-config-snapshot` command. AWS Config stores configuration snapshots in the Amazon S3 bucket that you specified when you enabled AWS Config.

Enter the `deliver-config-snapshot` command by specifying the name assigned by AWS Config when you configured your delivery channel, for example:

```
$ aws configservice deliver-config-snapshot --delivery-channel-name default
{
    "configSnapshotId": "94ccff53-83be-42d9-996f-b4624b3c1a55"
}
```

Verifying Delivery Status

Enter the `describe-delivery-channel-status` command to verify that the AWS Config has started delivering the configurations to the specified delivery channel:

```
aws configservice describe-delivery-channel-status
```

The response lists the status of all the three delivery formats that AWS Config uses to deliver configurations to your bucket and topic.

```
{
    "DeliveryChannelsStatus": [
        {
            "configStreamDeliveryInfo": {
                "lastStatusChangeTime": 1415138614.125,
                "lastStatus": "SUCCESS"
            },
            "configHistoryDeliveryInfo": {
```

```
                "lastSuccessfulTime": 1415148744.267,
                "lastStatus": "SUCCESS",
                "lastAttemptTime": 1415148744.267
            },
            "configSnapshotDeliveryInfo": {
                "lastSuccessfulTime": 1415333113.4159999,
                "lastStatus": "SUCCESS",
                "lastAttemptTime": 1415333113.4159999
            },
            "name": "default"
        }
    ]
}
```

View the `lastSuccessfulTime` field in `configSnapshotDeliveryInfo`. The time should match the time you last requested the delivery of the configuration snapshot.

> **Note**
>
> AWS Config uses the UTC format (Coordinated Universal Time) to record the time.

Viewing Configuration Snapshots in Amazon S3 bucket

A *configuration snapshot* is a collection of the configuration items for the supported resources that exist in your account. This configuration snapshot is a complete picture of the resources that are being recorded and their configurations. The configuration snapshot can be a useful tool for validating your configuration. For example, you may want to examine the configuration snapshot regularly for resources that are configured incorrectly or that potentially should not exist. The configuration snapshot is available in multiple formats. You can have the configuration snapshot delivered to an Amazon Simple Storage Service (Amazon S3) bucket that you specify. Additionally, you can select a point in time in the AWS Config console and navigate through the snapshot of configuration items using the relationships between the resources.

Viewing Configuration Snapshots

1. Sign in to the AWS Management Console and open the Amazon S3 console at https://console.aws.amazon.com/s3/.
2. In the Amazon S3 console **All Buckets** list, choose the name of your Amazon S3 bucket.

3. Go through the nested folders in your bucket until you see the `ConfigSnapshot` object with a snapshot ID that matches with the ID returned by the command. Download and open the object to view the configuration snapshot.. The S3 bucket also contains an empty file named `ConfigWritabilityCheckFile`. AWS Config creates this file to verify that the service can successfully write to the S3 bucket.

Example Configuration Snapshot from AWS Config

The following is an example of the information that AWS Config includes in a configuration snapshot. The snapshot describes the configuration for the resources that AWS Config is recording in the current region for your AWS account, and it describes the relationships between these resources.

> **Note**
>
> The configuration snapshot can include references to resources types and resource IDs that are not supported.

```

The next step is to verify that configuration snapshot was delivered successfully to the delivery channel.

Notifications that AWS Config Sends to an Amazon SNS topic

> **Note**
>
> Before AWS Config can send notifications to an Amazon SNS topic, you must first set up the configuration recorder and the delivery channel. For more information, see Managing the Configuration Recorder and Managing the Delivery Channel.

You can configure AWS Config to stream configuration changes and notifications to an Amazon SNS topic. For example, when a resource is updated, you can get a notification sent to your email, so that you can view the changes. You can also be notified when AWS Config evaluates your custom or managed rules against your resources. For more information, see Logging and Monitoring in AWS Config.

AWS Config sends notifications for the following events:

- Configuration item change for a resource.
- Configuration history for a resource was delivered for your account.
- Configuration snapshot for recorded resources was started and delivered for your account.
- Compliance state of your resources and whether they are compliant with your rules.
- Evaluation started for a rule against your resources.
- AWS Config failed to deliver the notification to your account.

Topics

- Example Configuration Item Change Notifications
- Example Configuration History Delivery Notification
- Example Configuration Snapshot Delivery Started Notification
- Example Configuration Snapshot Delivery Notification
- Example Compliance Change Notification
- Example Rules Evaluation Started Notification
- Example Oversized Configuration Item Change Notification
- Example Delivery Failed Notification

Example Configuration Item Change Notifications

AWS Config uses Amazon SNS to deliver notifications to subscription endpoints. These notifications provide the delivery status for configuration snapshots and configuration histories, and they provide each configuration item that AWS Config creates when the configurations of recorded AWS resources change. AWS Config also sends notifications that show whether your resources are compliant against your rules. If you choose to have notifications sent by email, you can use filters in your email client application based on the subject line and message body of the email.

The following is an example payload of an Amazon SNS notification that is generated when AWS Config detects that the Amazon Elastic Block Store volume `vol-ce676ccc` is attached to the instance with an ID of `i-344c463d`. The notification contains the configuration item change for the resource.

Configuration Items for Resources with Relationships

If a resource is related to other resources, a change to that resource can result in multiple configuration items. The following example shows how AWS Config creates configuration items for resources with relationships.

1. You have an Amazon EC2 instance with an ID of `i-007d374c8912e3e90`, and the instance is associated with an Amazon EC2 security group, `sg-c8b141b4`.
2. You update your EC2 instance to change the security group to another security group, `sg-3f1fef43`.
3. Because the EC2 instance is related to another resource, AWS Config creates multiple configuration items like the following examples:

This notification contains the configuration item change for the EC2 instance when the security group is replaced.

Understanding the `configurationItemDiff` field in Amazon SNS `ConfigurationItemChangeNotification` notifications

AWS Config creates a configuration item whenever the configuration of a resource changes (create/update/delete). For a list of supported resource types that AWS Config can record, see Supported Resource Types for AWS Config. AWS Config uses Amazon SNS to deliver a notification as the changes occur. The Amazon SNS notification payload includes fields to help you track the resource changes in a given AWS Region.

To understand why you receive a `ConfigurationItemChangeNotification` notification, review the `configurationItemDiff` details. The fields vary depending on the change type and can form different combinations such as UPDATE-UPDATE, UPDATE-CREATE, and DELETE-DELETE. The following are explanations of some common combinations.

UPDATE-CREATE and UPDATE-UPDATE

The following example includes changes in the resource direct relationships and resource configurations. The `configurationItemDiff` details reveal the following information:

Action performed: A managed policy present in the account was attached to an AWS Identity and Access Management (IAM) role.

Basic operation performed: UPDATE (updating the number of associations of the resource type `AWS::IAM::Policy` in an account).

Change type combinations:

1. Resource direct relationship change UPDATE-CREATE. A new attachment or association was created between an IAM policy and an IAM role.
2. Resource configuration change UPDATE-UPDATE. The number IAM policy associations increased from 2 to 3 when the policy was attached to the IAM role.

Example UPDATE-CREATE and UPDATE-UPDATE `configurationItemDiff` notification:

```
{
    "configurationItemDiff": {
        "changedProperties": {
```

```
            "Relationships.0": {
                "previousValue": null,
                "updatedValue": {
                    "resourceId": "AROA6D3M4S53*********",
                    "resourceName": "Test1",
                    "resourceType": "AWS::IAM::Role",
                    "name": "Is attached to Role"
                },
                "changeType": "CREATE"                >>>>>>>>>>>>>>>>>>>> 1
            },
            "Configuration.AttachmentCount": {
                "previousValue": 2,
                "updatedValue": 3,
                "changeType": "UPDATE"                >>>>>>>>>>>>>>>>>>>> 2
            }
        },
        "changeType": "UPDATE"
    }
}
```

UPDATE-DELETE

The following example includes changes in the resource direct relationships and resource configurations. The `configurationItemDiff` details reveal the following information:

Action performed: A managed policy present in the account was detached from an IAM user.

Basic operation performed: UPDATE (updating the permissions policy associated with the resource type `AWS::IAM::User`).

Change type combinations: Resource direct relationship change UPDATE-DELETE. The association between an IAM user and an IAM policy in an account was deleted.

DELETE-DELETE

The following example includes changes in the resource direct relationships and resource configurations. The `configurationItemDiff` details reveal the following information:

Action performed: An IAM role present in an account was deleted.

Basic operation performed: DELETE (a resource of the resource type `AWS::IAM::Role` was deleted).

Change type combinations: Resource direct relationship change and resource configuration change DELETE-DELETE. The deletion of the IAM role also deleted the association of the IAM policy with the IAM role.

Example Configuration History Delivery Notification

The configuration history is a collection of the configuration items for a resource type over a time period. The following is an example notification that AWS Config sends when the configuration history for a CloudTrail trail resource is delivered for your account.

```
{
    "Type": "Notification",
    "MessageId": "ce49bf2c-d03a-51b0-8b6a-ef480a8b39fe",
    "TopicArn": "arn:aws:sns:us-east-2:123456789012:config-topic-ohio",
    "Subject": "[AWS Config:us-east-2] Configuration History Delivery Completed for
 Account 123456789012",
    "Message": {
        "s3ObjectKey": "AWSLogs/123456789012/Config/us-east-2/2016/9/27/

Example Compliance Change Notification

When AWS Config evaluates your resources against a custom or managed rule, AWS Config sends a notification that shows whether the resources are compliant against the rule.

The following is an example notification where the CloudTrail trail resource is compliant against the `cloudtrail-enabled` managed rule.

```
{
    "Type": "Notification",
    "MessageId": "11fd05dd-47e1-5523-bc01-55b988bb9478",
    "TopicArn": "arn:aws:sns:us-east-2:123456789012:config-topic-ohio",
    "Subject": "[AWS Config:us-east-2] AWS::::Account 123456789012 is COMPLIANT with
 cloudtrail-enabled in Accoun...",
    "Message": {
        "awsAccountId": "123456789012",

Example Oversized Configuration Item Change Notification

When AWS Config detects a configuration change for a resource, it sends a configuration item (CI) notification. If the notification exceeds the maximum size allowed by Amazon Simple Notification Service (Amazon SNS), the notification includes a brief summary of the configuration item.

You can view the complete notification in the Amazon S3 bucket location specified in the `s3BucketLocation` field.

The following example notification shows a CI for an Amazon EC2 instance. The notification includes a summary of the changes and the location of the notification in the Amazon S3 bucket.

```
View the Timeline for this Resource in the Console:
    https://console.aws.amazon.com/config/home?region=us-west-2#/timeline/
AWS::EC2::Instance/resourceId_14b76876-7969-4097-ab8e-a31942b02e80?
time=2016-10-06T16:46:16.261Z

    The full configuration item change notification for this resource exceeded the
 maximum size allowed by Amazon Simple Notification Service (SNS). A summary of the
 configuration item is provided here. You can view the complete notification in the
 specified Amazon S3 bucket location.

```

How to access oversized configuration items

When a configuration item is oversized, only a summary is sent to Amazon SNS. The complete configuration item (CI) is stored in Amazon S3

The following code example shows how to access the the complete CI.

```
import boto3
import json

def handle_oversized_configuration_item(event):
    """
    Example of handling an oversized configuration item notification

    When a configuration item is oversized:
    1. AWS Config sends a summary notification through SNS
    2. The complete configuration item is stored in S3
    3. Use get_resource_config_history API to retrieve the complete configuration
    """

    # Extract information from the summary notification
    if event['messageType'] == 'OversizedConfigurationItemChangeNotification':
        summary = event['configurationItemSummary']
        resource_type = summary['resourceType']
        resource_id = summary['resourceId']

        # Initialize AWS Config client
        config_client = boto3.client('config')

        # Retrieve the complete configuration item
```

```
        response = config_client.get_resource_config_history(
            resourceType=resource_type,
            resourceId=resource_id
        )

        if response['configurationItems']:
            config_item = response['configurationItems'][0]

            # For EC2 instances, the configuration contains instance details
            configuration = json.loads(config_item['configuration'])
            print(f"Instance Configuration: {configuration}")

            # Handle supplementary configuration if present
            if 'supplementaryConfiguration' in config_item:
                for key, value in config_item['supplementaryConfiguration'].items():
                    if isinstance(value, str):
                        config_item['supplementaryConfiguration'][key] =
 json.loads(value)
                print(f"Supplementary Configuration:
 {config_item['supplementaryConfiguration']}")

            return config_item

        # If needed, you can also access the complete notification from S3
        s3_location = event['s3DeliverySummary']['s3BucketLocation']
        print(f"Complete notification available in S3: {s3_location}")

    return None
```

How it works

1. The function accepts an event parameter containing the AWS Config notification.
2. It checks if the message type is an oversized configuration notification.
3. The function extracts the resource type and ID from the summary.
4. Using the AWS Config client, it retrieves the complete configuration history.
5. The function processes both main and supplementary configurations.
6. If needed, you can access the complete notification from the provided S3 location.

Example Delivery Failed Notification

AWS Config sends a delivery failed notification if AWS Config can't deliver the configuration snapshot or an oversized configuration item change notification to your Amazon S3 bucket. Verify that you specified a valid Amazon S3 bucket.

```
View the Timeline for this Resource in the Console:
    https://console.aws.amazon.com/config/home?region=us-west-2#/timeline/

```

Viewing the AWS Config Dashboard

Use the **Dashboard** to see an overview of your resources, rules, conformance packs, and their compliance states and to visualize your AWS Config usage and success metrics with Amazon CloudWatch. This page helps you quickly identify the top resources in your AWS account, the conformance packs with the lowest level of compliance in your AWS account, what rules or resources are noncompliant in your AWS account, what traffic is driving your AWS Config usage, and key metrics for success and failure that have occured in your workflows.

To use the AWS Config Dashboard

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. In the left navigation pane, choose **Dashboard**.

Contents

- Compliance and Resource Inventory
- AWS Config Usage and Success Metrics

Compliance and Resource Inventory

After setup, AWS Config starts recording your specified resources and evaluating them against your rules. It may take a few minutes for AWS Config to display your resources, rules, conformance packs, and their compliance states.

Conformance packs by compliance score

Conformance packs by compliance score displays up to 10 of your conformance packs with the lowest compliance score. A compliance score is the percentage of the number of compliant rule-resource combinations in a conformance pack compared to the number of total possible rule-resource combinations in the conformance pack.

This metric provides you with a high-level view of the compliance state of your conformance packs, and can be used to identify, investigate, and understand the level of compliance in your conformance packs. You can use the compliance score to track remediation progress, perform

comparisons across different sets of requirements, and see the impact a specific change or deployment has on a conformance pack.

To view the deployment status, compliance score, compliance score timeline, and rules for a conformance pack in a detailed view, choose the name of the conformance pack under **Conformance pack**.

Compliance status

Compliance status displays the number of your compliant and noncompliant rules and compliant and noncompliant resources. Resources are compliant or noncompliant based on an evaluation of the rule associated with it. If a resource does not follow the rule's specifications, the resource and the rule are flagged as noncompliant.

To view the list of noncompliant rules and resources, choose **Noncompliant rule(s)** or **Noncompliant resource(s)**.

Rules by noncompliant resources

Rules by noncompliant resources displays your top noncompliant rules in descending order by the number of resources. Choose a rule to view its details, parameters, and the resources in scope for that specific rule.

For a comprehensive list of noncompliant rules, choose **View all noncompliant rules**.

Resource inventory

Resource inventory displays the total number of resources that AWS Config is recording in descending order by the number of resources, and the count of each resource type in your AWS account. To open all resources for a resource type, choose that resource type to go to its **Resources inventory** page.

You can use the dropdown list to indicate which resource totals you want to view. By default, it is set to view **All resources**, but you can change it to AWS resources, Third-party resources, or Custom resources.

> **Note**
>
> The **Evaluate your AWS resource configuration using Config rules** message may appear on the **Dashboard** for the following reasons:

- You haven't set up AWS Config Rules for your AWS account. You can choose **Add rule** to go to the **Rules** page.
- AWS Config is still evaluating your resources against your rules. You can refresh the page to see the latest evaluation results.
- AWS Config evaluated your resources against your rules and did not find any resources in scope. You can specify the resources for AWS Config to record in the **Settings** page. For more information, see Recording AWS Resources with AWS Config.

AWS Config Usage and Success Metrics

You can use Amazon CloudWatch dashboards in the AWS Config console to visualize your AWS Config usage and success metrics.

For each dashboard, you can do the following:

- Adjust the dashboard time range to display data from the past **3 Hours**, **1 Day**, or **1 Week**.
- Choose the **Calender icon**, to enter a custom time range: either a **Relative** time for a past specified amount of time or an **Absolute** time range between two dates.
- You can change the time format to display dashboard data in **UTC** (Coordinated Universal Time) or **Local time zone** (the time zone specified as your local time zone in the operating system of your device).
- Use the **Drop arrow** next the **Refresh icon** to specify how often the data in a dashboard should refresh, or to turn off the automatic refresh. Choose **Off**, **10 Seconds**, **1 Minute**, **2 Minutes**, **5 Minutes**, or **15 Minutes** to change the refresh internal.
- Choose **More options** (the vertical ellipsis menu) to add the AWS Config usage metrics or the AWS Config success metrics you are currently viewing in the AWS Config Dashboard to the CloudWatch console. This opens a new tab in the CloudWatch console that allows you to create a new custom dashboard in CloudWatch with information copied from your current AWS Config usage metrics or AWS Config success metrics.

If you want to perform additional analyses of these metrics with CloudWatch, choose **Metrics** in the left navigation pane of the CloudWatch console and then choose **AWS/Config**. For more information on what you can do from the CloudWatch console, see Using Amazon CloudWatch dashboards and Using Amazon CloudWatch metrics in the *CloudWatch User Guide*.

AWS Config Usage Metrics

Metric	Description	Unit	
`Configuration Items Recorded`	The number of configuration items recorded for each resource type or all resource types. A configuration item represents a point-in-time view of the various attributes of a supported AWS resource. For more information about configuration items or supported resource types, see Configuration Items and Supported Resource Types.	Count	

You can select the resource type that you want to view by using the dropdown list. By default, it is set to view all resource types.

AWS Config Success Metrics

Metric	Description	Unit	
`Change Notifications Delivery Failed`	The number of failed change notification deliveries to the Amazon SNS topic for your delivery channel. A change notification informs you about a change to the configuration state of your AWS resources. You can use the ConfigStreamDeliveryInfo API to get the `lastErrorCode` or `lastErrorMessage` for the last attempted delivery for a change notification. For more information, see Managing the Delivery Channel.	Count	
`Config History Export Failed`	The number of failed configuration history exports to your Amazon S3 bucket. A configuration history is a collection of the configuration items for a given resource over a specified time period. For more	Count	

Metric	Description	Unit
	information about configuration history, see Configuration History.	
`Configuration Recorder Insufficient Permissions Failure`	The number of failed permission access attempts due to the IAM role policy for all the configuration recorders in your account and AWS Region having insufficient permissions. The configuration recorder detects changes in to the resource types in scope. For the configuration recorder to record your AWS resource configurations, it requires the necessary IAM permissions. For more information, see IAM Role Policy for Getting Configuration Details.	Count
`Config Snapshot Export Failed`	The number of failed configuration snapshot exports to your Amazon S3 bucket. A configuration snapshot is a collection of the configuration items for the supported resources in your account. For more information about configuration snapshots, see Configuration Snapshot.	Count

Managing and Viewing AWS Resource Configurations with AWS Config

AWS Config allows you to assess, audit, and evaluate the configurations of AWS resources.

AWS resources are entities that you create and manage using the AWS Management Console, the AWS Command Line Interface (CLI), the AWS SDKs, or AWS partner tools. Examples of AWS resources include Amazon EC2 instances, security groups, Amazon VPCs, and Amazon Elastic Block Store. AWS Config refers to each resource using its unique identifier, such as the resource ID or an Amazon Resource Name (ARN).

Some common use cases include:

- **Cloud administrator**: You can track and manage resource configurations to help ensure compliance, troubleshoot issues, and maintain an understanding of your AWS environment
- **Security analyst**: You can evaluate resource configurations against desired states to help identify vulnerabilities and assess security posture.
- **Compliance officer**: You can continuously audit and monitor resource configurations to help ensure adherence to organizational policies and industry standards.

Topics

- Supported Resource Types for AWS Config
- Resource Coverage by Region Availability
- Recording AWS Resources with AWS Config
- Recording Configurations with AWS Config for Third-Party Resources using the AWS CLI
- Recording Software Configuration for Managed Instances with AWS Config
- Looking Up Resources That Are Discovered by AWS Config
- Viewing Compliance Information and Evaluation Results for your AWS Resources with AWS Config
- Viewing Compliance History for your AWS Resources with AWS Config
- Querying Compliance History for your AWS Resources
- Tagging Your AWS Config Resources

Supported Resource Types for AWS Config

> **Important**
>
> This page is updated on a monthly cadence at the beginning of each month.

AWS Config supports the following AWS resources types and resource relationships.

- For more detailed information about a resource type, see its reference information (such as syntax, properties and return values) in the AWS resource and property types reference in the AWS CloudFormation User Guide.
- For AWS Config recording, some AWS Regions support a subset of these resource types. For information on which resource types are supported in which Regions, see Resource Coverage by Region Availability.
- Advanced queries for AWS Config supports a subset of these resource types. For a list of those supported resource types, see Supported Resource Types for Advanced Queries.
- Proactive evaluation for AWS Config supports a subset of these resource types. For a list of those supported resource types, see Supported Resource Types for Proactive Evaluation.
- Periodic rules run without the configuration recorder being enabled since periodic rules do not depend on configuration items (CIs). For more information on the difference between change–triggered rules and periodic rules, see Evaluation Mode and Trigger Types for AWS Config Rules.

  This means that if you view the rule page, there is no listed CI or supported resource. If you select the resource ID, you will see the following error: `The provided resource ID and resource type cannot be found`. This is expected behavior.

> **Note**
>
> **Region availability for resource types**
>
> Before specifying a resource type for AWS Config to track, check Resource Coverage by Region Availability to see if the resource type is supported in the AWS Region where you set up AWS Config. If a resource type is supported by AWS Config in at least one Region, you can enable the recording of that resource type in all Regions supported by AWS Config, even if the specified resource type is not supported in the AWS Region where you set up AWS Config.

Tagging support for resource types
If a resource type does not support tagging or does not include tag information in its describe API response, AWS Config won't capture tag data in the configuration items (CIs) for that resource type. AWS Config will still record these resources. However, any functionality that relies on tag data won't work. This affects tag-based filtering, grouping, or compliance evaluation that relies on tag data.

Amazon AppStream

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon AppStream	`AWS::AppStream::Application`	NA	NA	
	`AWS::AppStream::AppBlockBuilder`	NA	NA	
	`AWS::AppStream::DirectoryConfig`	NA	NA	
	`AWS::AppStream::Fleet`	NA	NA	
	`AWS::AppStream::Stack`	NA	NA	

Amazon AppFlow

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon AppFlow	`AWS::AppFlow::Flow`	NA	NA	

Amazon AppIntegrations

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon AppIntegrations	`AWS::AppIntegrations::EventIntegration`	NA	NA	
	`AWS::AppIntegrations::Application`	NA	NA	

Amazon API Gateway

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
API Gateway	`AWS::ApiGateway::DomainName`	NA	NA	
	`AWS::ApiGateway::D`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`omainNameV2`			
	`AWS::ApiGateway::Stage`	is contained in	ApiGateway Rest Api	
		is associated with	WAFRegional WebACL	
	`AWS::ApiGateway::Method`	NA	NA Stage	
	`AWS::ApiGateway::RestApi`	contains	ApiGateway Stage	
	`AWS::ApiGateway::UsagePlan`	NA	NA	
API Gateway V2	`AWS::ApiGatewayV2::Stage`	is contained in	ApiGatewayV2 Api	
	`AWS::ApiGatewayV2::Api`	contains	ApiGatewayV2 Stage	
	`AWS::ApiGatewayV2::Integration`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::ApiGatewayV2::VpcLink`	NA	NA	

To learn more about how AWS Config integrates with Amazon API Gateway, see Monitoring API Gateway API Configuration with AWS Config.

Amazon Athena

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Athena	`AWS::Athena::WorkGroup`	NA	NA	
	`AWS::Athena::DataCatalog`	NA	NA	
	`AWS::Athena::PreparedStatement`	NA	NA	

Amazon Bedrock

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Bedrock	`AWS::Bedrock::ApplicationIn`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`ferenceProfile`			
	`AWS::Bedrock::AutomatedReasoningPolicy`	NA	NA

	AWS::Bedrock::Flow	NA	NA	
	AWS::Bedrock::FlowAlias	NA	NA	
	AWS::Bedrock::FlowVersion	NA	NA	
	AWS::Bedrock::Guardrail	NA	NA	
	AWS::Bedrock::KnowledgeBase	NA	NA	
	AWS::Bedrock::Prompt	NA	NA	
	AWS::Bedrock::PromptVersion	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	AWS::BedrockAgentCore::ApiKeyCredentialProvider	NA	NA	
	AWS::BedrockAgentCore::BrowserCustom	NA	NA	
	AWS::BedrockAgentCore::CodeInterpreterCustom	NA	NA	
	AWS::BedrockAgentCore::Evaluator	NA	NA	
	AWS::BedrockAgentCore::Gateway	NA	NA	
	AWS::BedrockAgentCore::GatewayTarget	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::BedrockAgentCore::Memory`	NA	NA	Recording configuration items for resource deletion events might take up to 360 hours to reflect in AWS Config.
	`AWS::BedrockAgentCore::OAuth2CredentialProvider`	NA	NA	
	`AWS::BedrockAgentCore::OnlineEvaluationConfig`	NA	NA	
	`AWS::BedrockAgentCore::PaymentManager`	NA	NA	
	`AWS::BedrockAgentCore::Policy`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	AWS::BedrockAgentCore::PolicyEngine	NA	NA	
	AWS::BedrockAgentCore::Runtime	NA	NA	
	AWS::BedrockAgentCore::RuntimeEndpoint	NA	NA	
	AWS::BedrockAgentCore::TokenVault	NA	NA	
	AWS::BedrockAgentCore::WorkloadIdentity	NA	NA	

Amazon Chime

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Chime	`AWS::Chime::AppInstance`	NA	NA	

Amazon CloudFront

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon CloudFront	`AWS::CloudFront::Distribution`	is associated with	AWS WAF WebACL	
			ACM Certificate	
			S3 Bucket	
			IAM Server Certificate	
	`AWS::CloudFront::KeyValueStore`	NA	NA	
	`AWS::CloudFront::PublicKey`	NA	NA	
	`AWS::CloudFront::StreamingD`	is associated with	AWS WAF WebACL	
			ACM Certificate	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`istribution`		S3 Bucket	
			IAM Server Certificate	
	`AWS::CloudFront::RealtimeLogConfig`	NA	NA	

Amazon CloudWatch

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon CloudWatch	`AWS::CloudWatch::Alarm`	NA	NA	
	`AWS::CloudWatch::MetricStream`	NA	NA	
Amazon CloudWatch Application Signals	`AWS::ApplicationSignals::ServiceLevelObjective`	NA	NA	
Amazon CloudWatch Internet Monitor	`AWS::InternetMonitor::Monitor`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon CloudWatch Logs	`AWS::Logs::Destination`	NA	NA	
	`AWS::Logs::ResourcePolicy`	NA	NA	
Amazon CloudWatch RUM	`AWS::RUM::AppMonitor`	NA	NA	
Amazon CloudWatch Evidently	`AWS::Evidently::Project`	NA	NA	
	`AWS::Evidently::Launch`	NA	NA	
	`AWS::Evidently::Segment`	NA	NA	

Amazon CodeGuru

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon CodeGuru Reviewer	`AWS::CodeGuruReviewer::Repo`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`sitoryAssociation`			
Amazon CodeGuru Profiler	`AWS::CodeGuruProfiler::ProfilingGroup`	NA	NA	

Amazon Cognito

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Cognito	`AWS::Cognito::IdentityPool`	NA	NA	
	`AWS::Cognito::IdentityPoolRoleAttachment`	NA	NA	
	`AWS::Cognito::LogDeliveryConfiguration`	NA	NA	
	`AWS::Cognito::UserPool`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	AWS::Cognito::UserPoolClient	NA	NA	
	AWS::Cognito::UserPoolDomain	NA	NA	
	AWS::Cognito::UserPoolGroup	NA	NA	
	AWS::Cognito::UserPoolIdentityProvider	NA	NA	
	AWS::Cognito::UserPoolResourceServer	NA	NA	
	AWS::Cognito::UserPoolUICustomizationAttachment	NA	NA	

Amazon Comprehend

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Comprehend	`AWS::Comprehend::Flywheel`	NA	NA	

Connect Customer

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Connect Customer	`AWS::Connect::AgentStatus`	NA	NA	
	`AWS::Connect::EvaluationForm`	NA	NA	
	`AWS::Connect::Instance`	NA	NA	
	`AWS::Connect::PhoneNumber`	NA	NA	
	`AWS::Connect::PredefinedAttribute`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::Connect::Prompt`	NA	NA	Recording configuration items for resource deletion events might take up to 120 hours to reflect in AWS Config.
	`AWS::Connect::QuickConnect`	NA	NA	
	`AWS::Connect::RoutingProfile`	NA	NA	Recording configuration items for resource deletion events might take up to 120 hours to reflect in AWS Config.
	`AWS::Connect::Rule`	NA	NA	
	`AWS::Connect::SecurityProfile`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::Connect::TaskTemplate`	NA	NA	Recording configuration items for resource deletion events might take up to 120 hours to reflect in AWS Config.
	`AWS::Connect::User`	NA	NA	
	`AWS::Connect::UserHierarchyGroup`	NA	NA	
	`AWS::Connect::View`	NA	NA	
	`AWS::Connect::ViewVersion`	NA	NA	
Connect Customer Customer Profiles	`AWS::CustomerProfiles::Domain`	NA	NA	
	`AWS::CustomerProfiles::ObjectType`	NA	NA	

Amazon Detective

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Detective	`AWS::Detective::Graph`	NA	NA	
	`AWS::Detective::OrganizationAdmin`	NA	NA

	`AWS::ImageBuilder::LifecyclePolicy`	NA	NA	

*AWS Config records the configuration details of Dedicated hosts and the instances that you launch on them. As a result, you can use AWS Config as a data source when you report compliance with

your server-bound software licenses. For example, you can view the configuration history of an instance and determine which Amazon Machine Image (AMI) it is based on. Then, you can look up the configuration history of the host, which includes details such as the numbers of sockets and cores, to check that the host complies with the license requirements of the AMI. For more information, see Tracking Configuration Changes with AWS Config in the *Amazon EC2 User Guide*.

*The EC2 SecurityGroup Properties definition contains IP CIDR blocks, which are converted to IP ranges internally, and may return unexpected results when trying to find a specific IP range. For workarounds to search for specific IP ranges, see Limitations for Advanced Queries.

Amazon Elastic Container Registry

AWS Service	Resource Type Value	Relationship	Related Resource	Notes

Amazon OpenSearch Service	`AWS::OpenSearch::Domain`	NA	NA	
Amazon OpenSearch Serverless	`AWS::OpenSearchServerless::VpcEndpoint`	NA	NA	
	`AWS::OpenSearchSer`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`verless::Collection`			
	`AWS::OpenSearchServerless::SecurityConfig`	NA	NA	
	`AWS::OpenSearchServerless::SecurityPolicy`	NA	NA	
	`AWS::OpenSearchServerless::AccessPolicy`	NA	NA	
	`AWS::OpenSearchServerless::LifecyclePolicy`	NA	NA	

Amazon OpenSearch Service rename

On September 8, 2021, Amazon Elasticsearch Service was renamed to Amazon OpenSearch Service. OpenSearch Service supports OpenSearch as well as legacy Elasticsearch OSS. For more information, see Amazon OpenSearch Service - Summary of changes.

You might continue to see your data for `AWS::OpenSearch::Domain` under the existing `AWS::Elasticsearch::Domain` resource type for several weeks, even if you upgrade one or more domains to OpenSearch.

Amazon OpenSearch Ingestion

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon OpenSearch Ingestion	`AWS::OSIS::Pipeline`	NA	NA	

Amazon Personalize

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Personalize	`AWS::Personalize::Dataset`	NA	NA	
	`AWS::Personalize::Schema`	NA	NA	
	`AWS::Personalize::Solution`	NA	NA	
	`AWS::Personalize::DatasetGroup`	NA	NA	

Amazon Pinpoint

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Pinpoint	`AWS::Pinpoint::ApplicationSettings`	NA	NA	
	`AWS::Pinpoint::Segment`	NA	NA	
	`AWS::Pinpoint::App`	NA	NA	
	`AWS::Pinpoint::Campaign`	NA	NA	
	`AWS::Pinpoint::InAppTemplate`	NA	NA	
	`AWS::Pinpoint::EmailChannel`	NA	NA	
	`AWS::Pinpoint::EmailTemplate`	NA	NA	
	`AWS::Pinpoint::EventStream`	NA	NA	

Amazon Quantum Ledger Database (Amazon QLDB)

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon QLDB	`AWS::QLDB::Ledger`	NA	NA	

Amazon Kendra

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Kendra	`AWS::Kendra::Index`	NA	NA	

Amazon Kinesis

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Kinesis	`AWS::Kinesis::ResourcePolicy`	NA	NA	Recording configuration items for resource deletion events might take up to 120 hours to reflect in AWS Config.
	`AWS::Kinesis::Stream`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::Kinesis::StreamConsumer`	NA	NA	
Amazon Kinesis Analytics V2	`AWS::KinesisAnalyticsV2::Application`	NA	NA	
Amazon Data Firehose	`AWS::KinesisFirehose::DeliveryStream`	NA	NA	
Kinesis video stream	`AWS::KinesisVideo::SignalingChannel`	NA	NA	
	`AWS::KinesisVideo::Stream`	NA	NA	

Amazon Lex V2

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Lex V2	`AWS::Lex::BotAlias`	NA	NA	
	`AWS::Lex::Bot`	NA	NA	

Amazon Lightsail

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Lightsail	`AWS::Lightsail::Disk`	NA	NA	
	`AWS::Lightsail::Certificate`	NA	NA	
	`AWS::Lightsail::Bucket`	NA	NA	
	`AWS::Lightsail::StaticIp`	NA	NA	
	`AWS::Lightsail::Container`	NA	NA	
	`AWS::Lightsail::Database`	NA	NA	
	`AWS::Lightsail::Distribution`	NA	NA	
	`AWS::Lightsail::Domain`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::Lightsail::Instance`	NA	NA	
	`AWS::Lightsail::LoadBalancer`	NA	NA	

Amazon Lookout for Metrics

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Lookout for Metrics	`AWS::LookoutMetrics::Alert`	NA	NA	

Amazon Lookout for Vision

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Lookout for Vision	`AWS::LookoutVision::Project`	NA	NA	

Amazon Macie

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Macie	`AWS::Macie::Session`	NA	NA	

Amazon Managed Grafana

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Managed Grafana	`AWS::Grafana::Workspace`	NA	NA	

Amazon Managed Service for Prometheus

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Managed Service for Prometheus	`AWS::APS::RuleGroupsNamespace`	NA	NA	

Amazon MemoryDB

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon MemoryDB	`AWS::MemoryDB::SubnetGroup`	NA	NA	

Amazon MQ

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon MQ	`AWS::AmazonMQ::Broker`	NA	NA	

Amazon Managed Streaming for Apache Kafka

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Managed Streaming for Apache Kafka	`AWS::MSK::Cluster`	NA	NA	
	`AWS::MSK::Configuration`	NA	NA	
	`AWS::MSK::BatchScramSecret`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::MSK::ClusterPolicy`	NA	NA	
	`AWS::MSK::ServerlessCluster`	NA	NA	
	`AWS::MSK::VpcConnection`	NA	NA	
Amazon Managed Streaming for Apache Kafka Connect	`AWS::KafkaConnect::Connector`	NA	NA	
	`AWS::KafkaConnect::CustomPlugin`	NA	NA	

Amazon Lex V2

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Q Business	`AWS::QBusiness::Application`	NA	NA	

AWS Quick

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Quick	`AWS::QuickSight::Dashboard`	NA	NA	
	`AWS::QuickSight::DataSet`	NA	NA	
	`AWS::QuickSight::DataSource`	NA	NA	
	`AWS::QuickSight::RefreshSchedule`	NA	NA	
	`AWS::QuickSight::Template`	NA	NA	
	`AWS::QuickSight::Theme`	NA	NA	

Amazon Redshift

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Redshift	`AWS::Redshift::Cluster`	is associated with	Cluster parameter group	
			Cluster security group	
			Cluster subnet group	
			Security group	
			Virtual private cloud (VPC)	
	`AWS::Redshift::ClusterParameterGroup`	NA	NA	
	`AWS::Redshift::ClusterSecurityGroup`	NA	NA	
	`AWS::Redshift::ScheduledAction`	NA	NA	
	`AWS::Redshift::ClusterSnapshot`	is associated with	Cluster	
			Virtual private cloud (VPC)	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::Redshift::ClusterSubnetGroup`	is associated with	Subnet	
			Virtual private cloud (VPC)	
	`AWS::Redshift::EventSubscription`	NA	NA	
	`AWS::Redshift::EndpointAccess`	NA	NA	
	`AWS::Redshift::EndpointAuthorization`	NA	NA	
	`AWS::Redshift::Integration`	NA	NA	

Amazon Relational Database Service

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Relational Database Service	`AWS::RDS::DBCluster`	contains	RDS DB instance	
		is associated with	RDS DB subnet group	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
			EC2 security group	
	`AWS::RDS::DBClusterSnapshot`	is associated with	RDS DB cluster	
			Virtual private cloud (VPC)	
	`AWS::RDS::DBInstance`	is associated with	EC2 security group	
			RDS DB security group	
			RDS DB subnet group	
	`AWS::RDS::DBProxy`	NA	NA	
	`AWS::RDS::DBSecurityGroup`	is associated with	EC2 security group	
			Virtual private cloud (VPC)	
	`AWS::RDS::DBSnapshot`	is associated with	Virtual private cloud (VPC)	
	`AWS::RDS::DBSubnetGroup`	is associated with	EC2 security group	
			Virtual private cloud (VPC)	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::RDS::EventSubscription`	NA	NA	
	`AWS::RDS::GlobalCluster`	NA	NA	
	`AWS::RDS::Integration`	NA	NA	
	`AWS::RDS::OptionGroup`	NA	NA	

Amazon Route 53

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Route 53	`AWS::Route53::DNSSEC`	NA	NA	
	`AWS::Route53::HostedZone`	NA	NA	
	`AWS::Route53::HealthCheck`	NA	NA	
Amazon Route 53 Profiles	`AWS::Route53Profiles::Profile`	NA	NA	
	`AWS::Route53Profiles::ProfileAssociation`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Route 53 Resolver	AWS::Route53Resolver::ResolverEndpoint	NA	NA	
	AWS::Route53Resolver::ResolverRule	NA	NA	
	AWS::Route53Resolver::ResolverRuleAssociation	NA	NA	
	AWS::Route53Resolver::FirewallDomainList	NA	NA	
	AWS::Route53Resolver::FirewallRuleGroupAssociation	NA	NA	
	AWS::Route53Resolver::ResolverQueryLoggingConfig	NA	NA	
	AWS::Route53Resolver::ResolverQueryLoggingConfigAssociation	NA	NA	
	AWS::Route53Resolver::FirewallRuleGroup	NA	NA	
Amazon Application Recovery Controller (ARC)	AWS::ARCZonalShift::AutoshiftObserverNotificationStatus	NA	NA	
	AWS::Route53RecoveryReadiness::Cell	NA	NA	
	AWS::Route53RecoveryReadiness::ReadinessCheck	NA	NA	
	AWS::Route53RecoveryReadiness::RecoveryGroup	NA	NA	
	AWS::Route53RecoveryControl::Cluster	NA	NA	
	AWS::Route53RecoveryControl::ControlPanel	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	AWS::Route53RecoveryControl::RoutingControl	NA	NA	
	AWS::Route53RecoveryControl::SafetyRule	NA	NA	
	AWS::Route53RecoveryReadiness::ResourceSet	NA	NA	

Amazon SageMaker AI

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon SageMaker AI	AWS::SageMaker::Action	NA	NA	
	AWS::SageMaker::Algorithm	NA	NA	
	AWS::SageMaker::App	NA	NA	
	AWS::SageMaker::AppImageConfig	NA	NA	
	AWS::SageMaker::Cluster	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	AWS::SageMaker::CodeRepository	NA	NA	
	AWS::SageMaker::Context	NA	NA	
	AWS::SageMaker::DataQualityJobDefinition	NA	NA	
	AWS::SageMaker::Domain	NA	NA	
	AWS::SageMaker::EndpointConfig	NA	NA	
	AWS::SageMaker::Endpoint	NA	NA	
	AWS::SageMaker::FeatureGroup	NA	NA	
	AWS::SageMaker::Hub	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	AWS::SageMaker::Image	NA	NA	
	AWS::SageMaker::ImageVersion	NA	NA	
	AWS::SageMaker::InferenceComponent	NA	NA	
	AWS::SageMaker::InferenceExperiment	NA	NA	
	AWS::SageMaker::MlflowApp	NA	NA	
	AWS::SageMaker::MlflowTrackingServer	NA	NA	
	AWS::SageMaker::Model	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	AWS::SageMaker::ModelBiasJobDefinition	NA	NA	
	AWS::SageMaker::ModelCard	NA	NA	
	AWS::SageMaker::ModelExplainabilityJobDefinition	NA	NA	
	AWS::SageMaker::ModelPackage	NA	NA	
	AWS::SageMaker::ModelQualityJobDefinition	NA	NA	
	AWS::SageMaker::ModelPackageGroup	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	AWS::SageMaker::MonitoringSchedule	NA	NA	
	AWS::SageMaker::NotebookInstance	NA	NA	
	AWS::SageMaker::NotebookInstanceLifecycleConfig	NA	NA	
	AWS::SageMaker::PartnerApp	NA	NA	
	AWS::SageMaker::Pipeline	NA	NA	
	AWS::SageMaker::Project	NA	NA	
	AWS::SageMaker::Space	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::SageMaker::StudioLifecycleConfig`	NA	NA	
	`AWS::SageMaker::UserProfile`	NA	NA	
	`AWS::SageMaker::Workteam`	NA	NA	

Amazon Simple Email Service

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Simple Email Service	`AWS::SES::ConfigurationSet`	NA	NA	
	`AWS::SES::ContactList`	NA	NA	
	`AWS::SES::DedicatedIpPool`	NA	NA	
	`AWS::SES::MailManagerArchive`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::SES::MailManagerTrafficPolicy`	NA	NA	
	`AWS::SES::Template`	NA	NA	
	`AWS::SES::ReceiptFilter`	NA	NA	
	`AWS::SES::ReceiptRuleSet`	NA	NA	

Amazon Simple Notification Service

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Simple Notification Service	`AWS::SNS::Topic`	NA	NA	

Amazon Simple Queue Service

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Simple Queue Service	`AWS::SQS::Queue`	NA	NA	

Amazon Simple Storage Service

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Simple Storage Service	`AWS::S3::AccountPublicAccessBlock`	NA	NA	
	`AWS::S3::MultiRegionAccessPoint`	NA	NA	
	`AWS::S3::StorageLens`	NA	NA	
	`AWS::S3::AccessGrant`	NA	NA	
	`AWS::S3::AccessGrantsInstance`	NA	NA	
	`AWS::S3::AccessGrantsLocation`	NA	NA	
	`AWS::S3::AccessPoint`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::S3::Bucket` *	NA	NA	
	`AWS::S3::BucketPolicy` *	NA	NA	Resource metadata is included in the associated AWS::S3::Bucket CI
	`AWS::S3::StorageLensGroup`	NA	NA	
	`AWS::S3Tables::TableBucket`	NA	NA	
	`AWS::S3Tables::TableBucketPolicy`	NA	NA	
Amazon S3 Express One Zone	`AWS::S3Express::DirectoryBucket`	NA	NA	
	`AWS::S3Express::BucketPolicy`	NA	NA	

*If you configured AWS Config to record your S3 buckets, and are not receiving configuration change notifications, check that your S3 bucket policies have the required permissions. For more information, see Managing Permissions for S3 Bucket Recording.

Amazon S3 Bucket Attributes

AWS Config also records the following attributes for the Amazon S3 bucket resource type.

Attributes	Description
AccelerateConfiguration	Transfer acceleration for data over long distances between your client and a bucket.
BucketAcl	Access control list used to manage access to buckets and objects.
BucketPolicy	Policy that defines the permissions to the bucket.
CrossOriginConfiguration	Allow cross-origin requests to the bucket.
LifecycleConfiguration	Rules that define the lifecycle for objects in your bucket.
LoggingConfiguration	Logging used to track requests for access to the bucket.
NotificationConfiguration	Event notifications used to send alerts or trigger workflows for specified bucket events.
ReplicationConfiguration	Automatic, asynchronous copying of objects across buckets in different AWS Regions.
RequestPaymentConfiguration	Requester pays is enabled.
TaggingConfiguration	Tags added to the bucket to categorize. You can also use tagging to track billing.
WebsiteConfiguration	Static website hosting is enabled for the bucket.
VersioningConfiguration	Versioning is enabled for objects in the bucket.

For more information about the attributes, see Bucket Configuration Options in the *Amazon Simple Storage Service User Guide*.

Amazon S3 Vectors

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon S3 Vectors	`AWS::S3Vectors::Index`	NA	NA	
	`AWS::S3Vectors::VectorBucket`	NA	NA	
	`AWS::S3Vectors::VectorBucketPolicy`	NA	NA	

Amazon Verified Permissions

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Verified Permissions	`AWS::VerifiedPermissions::IdentitySource`	NA	NA	Recording configuration items for resource deletion events might take up to 120 hours to reflect in AWS Config.

Amazon WorkSpaces

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon WorkSpaces	`AWS::WorkSpaces::ConnectionAlias`	NA	NA	
	`AWS::WorkSpaces::Workspace`	NA	NA	

Amazon WorkSpaces Secure Browser

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon WorkSpaces Secure Browser	`AWS::WorkSpacesWeb::TrustStore`	NA	NA	
	`AWS::WorkSpacesWeb::UserAccessLoggingSettings`	NA	NA	

AWS Amplify

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Amplify	`AWS::Amplify::App`	NA	NA	
	`AWS::Amplify::Branch`	NA	NA	

AWS AppConfig

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS AppConfig	`AWS::AppConfig::Application`	NA	NA	
	`AWS::AppConfig::Environment`	NA	NA	
	`AWS::AppConfig::ConfigurationProfile`	NA	NA	
	`AWS::AppConfig::DeploymentStrategy`	NA	NA	
	`AWS::AppConfig::Ho`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`stedConfigurationVersion`			
	`AWS::AppConfig::Extension`	NA	NA	
	`AWS::AppConfig::ExtensionAssociation`	NA	NA	

AWS App Runner

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS App Runner	`AWS::AppRunner::VpcConnector`	NA	NA	
	`AWS::AppRunner::Service`	NA	NA	

AWS App Mesh

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS App Mesh	`AWS::AppMesh::VirtualNode`	NA	NA	
	`AWS::AppMesh::VirtualService`	NA	NA	
	`AWS::AppMesh::VirtualGateway`	NA	NA	
	`AWS::AppMesh::VirtualRouter`	NA	NA	
	`AWS::AppMesh::Route`	NA	NA	
	`AWS::AppMesh::GatewayRoute`	NA	NA	
	`AWS::AppMesh::Mesh`	NA	NA	

AWS AppSync

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS AppSync	`AWS::AppSync::ChannelNamespace`	NA	NA	
	`AWS::AppSync::DataSource`	NA	NA	
	`AWS::AppSync::DomainName`	NA	NA	
	`AWS::AppSync::GraphQLApi`	NA	NA	
	`AWS::AppSync::SourceApiAssociation`	NA	NA	

AWS Audit Manager

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Audit Manager	`AWS::AuditManager::Assessment`	NA	NA	

AWS Auto Scaling

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Auto Scaling	`AWS::AutoScaling::AutoScalingGroup`	contains	Amazon EC2 instance	
		is associated with	Classic Load Balancer	
			Auto Scaling launch configuration	
			Subnet	
	`AWS::AutoScaling::LaunchConfiguration`	is associated with	Amazon EC2 security group	
	`AWS::AutoScaling::ScalingPolicy`	is associated with	Auto Scaling group	
			Alarm	
	`AWS::AutoScaling::ScheduledAction`	is associated with	Auto Scaling group	
	`AWS::AutoScaling::WarmPool`	NA	NA	

AWS B2B Data Interchange

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS B2B Data Interchange	`AWS::B2BI::Capability`	NA	NA	
	`AWS::B2BI::Transformer`	NA	NA	

AWS Backup

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Backup	`AWS::Backup::BackupPlan`	NA	NA*	
	`AWS::Backup::BackupSelection`	NA	NA	
	`AWS::Backup::BackupVault`	NA	NA*	
	`AWS::Backup::RecoveryPoint`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::Backup::ReportPlan`	NA	NA	
	`AWS::Backup::RestoreTestingPlan`	Na	NA	
AWS Backup Gateway	`AWS::BackupGateway::Hypervisor`	NA	NA	

Due to how AWS Backup works, some of these resource types relate to the other AWS Backup resource types in this table.

`AWS::Backup::BackupPlan` is related to `AWS::Backup::BackupSelection` where a Backup Plan has many selections, and `AWS::Backup::BackupVault` is related to `AWS::Backup::RecoveryPoint` where an AWS Backup Vault has multiple recovery points.

For more information, see Managing backups using backup plans and Working with backup vaults.

AWS Batch

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Batch	`AWS::Batch::ComputeEnvironment`	NA	NA	
	`AWS::Batch::Consum`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`ableResource`			
	`AWS::Batch::JobQueue`	NA	NA	
	`AWS::Batch::SchedulingPolicy`	NA	NA	

AWS Billing and Cost Management

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Billing and Cost Management	`AWS::BCMDataExports::Export`	NA	NA	

AWS Budgets

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Budgets	`AWS::Budgets::BudgetsAction`	NA	NA	

AWS Certificate Manager

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Certificate Manager	`AWS::ACM::Certificate`	NA	NA	

AWS Clean Rooms

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Clean Rooms	`AWS::CleanRooms::AnalysisTemplate`	NA	NA	
	`AWS::CleanRooms::Collaboration`	NA	NA	
	`AWS::CleanRooms::ConfiguredTable`	NA	NA	
	`AWS::CleanRooms::Membership`	NA	NA	
	`AWS::CleanRooms::PrivacyBud`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`getTemplate`			
AWS Clean Rooms ML	`AWS::CleanRoomsML::TrainingDataset`	NA	NA	

AWS CloudFormation

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
CloudFormation	`AWS::CloudFormation::GuardHook`	NA	NA	
	`AWS::CloudFormation::LambdaHook`	NA	NA	
	`AWS::CloudFormation::Stack` *	contains	Supported AWS resource types	
	`AWS::CloudFormation::StackSet`	NA	NA	

*AWS Config records configuration changes to CloudFormation stacks and supported resource types in the stacks. AWS Config does not record configuration changes for resource types in the stack that are not yet supported. Unsupported resource types appear in the supplementary configuration section of the configuration item for the stack.

AWS CloudTrail

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS CloudTrail	`AWS::CloudTrail::Trail`	NA	NA	
	`AWS::CloudTrail::EventDataStore`	NA	NA	
	`AWS::CloudTrail::ResourcePolicy`	NA	NA	

AWS Cloud9

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Cloud9	`AWS::Cloud9::EnvironmentEC2`	NA	NA	

AWS Cloud9 access no longer available to new users

After careful consideration, we have made the decision to close new customer access to AWS Cloud9, effective July 25, 2024. AWS Cloud9 existing customers can continue to use the service as normal. AWS continues to invest in security, availability, and performance improvements for AWS Cloud9, but we do not plan to introduce new features. For more information, see How to migrate from AWS Cloud9 to AWS IDE Toolkits or AWS CloudShell.

AWS Cloud Map

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Service Discovery	`AWS::ServiceDiscovery::Service`	NA	NA	
	`AWS::ServiceDiscovery::PublicDnsNamespace`	NA	NA	
	`AWS::ServiceDiscovery::HttpNamespace`	NA	NA	
	`AWS::ServiceDiscovery::Instance`	NA	NA	

AWS CodeArtifact

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS CodeArtifact	`AWS::CodeArtifact::Domain`	NA	NA	
	`AWS::CodeArtifact::PackageGroup`	NA	NA	Recording configuration items for resource deletion events might take up to 120 hours to reflect in AWS Config.
	`AWS::CodeArtifact::Repository`	NA	NA	

AWS CodeBuild

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS CodeBuild	`AWS::CodeBuild::Project` *	is associated with	S3 bucket	
			IAM role	
	`AWS::CodeBuild::ReportGroup`	NA	NA	

*To learn more about how AWS Config integrates with AWS CodeBuild, see Use AWS Config with AWS CodeBuild Sample.

AWS CodeDeploy

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS CodeDeploy	`AWS::CodeDeploy::Application`	contains	DeploymentGroup	
	`AWS::CodeDeploy::DeploymentConfig`	NA	NA	
	`AWS::CodeDeploy::DeploymentGroup`	is contained in	Application	

AWS CodePipeline

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS CodePipeline	`AWS::CodePipeline::Pipeline` *	is attached to	S3 bucket	
		is associated with	IAM role	
			Code project	
			Lambda function	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
			Cloudformation stack	
			ElasticBeanstalk application	
	`AWS::CodePipeline::Webhook`	NA	NA	

*AWS Config records configuration changes to CodePipeline pipelines and supported resource types in the pipelines. AWS Config does not record configuration changes for resource types in the pipelines that are not yet supported. Unsupported resource types such as `CodeCommit repository`, `CodeDeploy application`, `ECS cluster`, and `ECS service` appear in the supplementary configuration section of the configuration item for the stack.

AWS Config

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Config	`AWS::Config::AggregationAuthorization`	NA	NA	
	`AWS::Config::ResourceCompliance` *	is associated with	All resources*	
	`AWS::Config::ConformancePac`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	kCompliance			
	AWS::Config::ConfigurationRecorder *	NA	NA	
	AWS::Config::ConformancePack	NA	NA	
	AWS::Config::StoredQuery	NA	NA	
	AWS::Config::OrganizationConformancePack	NA	NA	

*The relationship between `AWS::Config::ResourceCompliance` and a related resource depends on how `AWS::Config::ResourceCompliance` reports compliance for that specific resource type.

*`AWS::Config::ConfigurationRecorder` is a system resource type of AWS Config and recording of this resource type is enabled by default.

> **Note**
>
> Recording for the `AWS::Config::ConformancePackCompliance` and `AWS::Config::ConfigurationRecorder` resource types come with no additional charge.

AWS Cost Explorer

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Cost Explorer	`AWS::CE::CostCategory`	NA	NA	

AWS Database Migration Service

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Database Migration Service	`AWS::DMS::EventSubscription`	NA	NA	
	`AWS::DMS::ReplicationSubnetGroup`	NA	NA	
	`AWS::DMS::ReplicationInstance`	NA	NA	
	`AWS::DMS::ReplicationTask`	NA	NA	
	`AWS::DMS::Certificate`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::DMS::Endpoint`	NA	NA	

AWS DataSync

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS DataSync	`AWS::DataSync::Agent`	NA	NA	
	`AWS::DataSync::LocationSMB`	NA	NA	
	`AWS::DataSync::LocationFSxLustre`	NA	NA	
	`AWS::DataSync::LocationFSxWindows`	NA	NA	
	`AWS::DataSync::LocationS3`	NA	NA	
	`AWS::DataSync::LocationEFS`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::DataSync::LocationNFS`	NA	NA	
	`AWS::DataSync::LocationHDFS`	NA	NA	
	`AWS::DataSync::LocationObjectStorage`	NA	NA	
	`AWS::DataSync::Task`	NA	NA	

Amazon Aurora DSQL

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon Aurora DSQL	`AWS::DSQL::Cluster`	NA	NA	

AWS Deadline Cloud

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Deadline Cloud	`AWS::Deadline::Fleet`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::Deadline::LicenseEndpoint`	NA	NA	
	`AWS::Deadline::Monitor`	NA	NA	
	`AWS::Deadline::QueueEnvironment`	NA	NA	Recording configuration items for resource deletion events might take up to 120 hours to reflect in AWS Config.
	`AWS::Deadline::QueueFleetAssociation`	NA	NA	
	`AWS::Deadline::StorageProfile`	NA	NA	

AWS Device Farm

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Device Farm	`AWS::DeviceFarm::TestGridProject`	NA	NA	
	`AWS::DeviceFarm::InstanceProfile`	NA	NA	
	`AWS::DeviceFarm::Project`	NA	NA	

AWS Elastic Beanstalk

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Elastic Beanstalk	`AWS::ElasticBeanstalk::Application`	contains	Elastic Beanstalk Application Version	
			Elastic Beanstalk Environment	
		is associated with	IAM role	
	`AWS::ElasticBeanstalk::Appl`	is contained in	Elastic Beanstalk Application	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`icationVersion`	is associated with	Elastic Beanstalk Environment	
			S3 bucket	
	`AWS::ElasticBeanstalk::Environment`	is contained in	Elastic Beanstalk Application	
		is associated with	Elastic Beanstalk Application Version	
			IAM role	
		contains	CloudFormation Stack	

AWS Entity Resolution

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Entity Resolution	`AWS::EntityResolution::IdMappingWorkflow`	NA	NA	
	`AWS::EntityResolution::MatchingWorkflow`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::EntityResolution::SchemaMapping`	NA	NA	

AWS Fault Injection Service

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Fault Injection Service	`AWS::FIS::ExperimentTemplate`	NA	NA	
	`AWS::FIS::TargetAccountConfiguration`	NA	NA	

AWS Global Accelerator

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Global Accelerator	`AWS::GlobalAccelerator::Listener`	NA	NA	
	`AWS::GlobalAcceler`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	ator::EndpointGroup			
	AWS::GlobalAccelerator::Accelerator	NA	NA	

AWS Glue

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Glue	AWS::Glue::Classifier	NA	NA	
	AWS::Glue::Crawler	NA	NA	
	AWS::Glue::Database	NA	NA	
	AWS::Glue::Job	NA	NA	
	AWS::Glue::MLTransform	NA	NA	
	AWS::Glue::Registry	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::Glue::Trigger`	NA	NA	

AWS Glue DataBrew

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Glue DataBrew	`AWS::DataBrew::Dataset`	NA	NA	
	`AWS::DataBrew::Job`	NA	NA	
	`AWS::DataBrew::Project`	NA	NA	
	`AWS::DataBrew::Recipe`	NA	NA	
	`AWS::DataBrew::Ruleset`	NA	NA	
	`AWS::DataBrew::Schedule`	NA	NA	

AWS Ground Station

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Ground Station	`AWS::GroundStation::Config`	NA	NA	
	`AWS::GroundStation::MissionProfile`	NA	NA	
	`AWS::GroundStation::DataflowEndpointGroup`	NA	NA	

AWS HealthLake

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS HealthLake	`AWS::HealthLake::FHIRDatastore`	NA	NA	

AWS Identity and Access Management (IAM)

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Identity and Access Management	`AWS::IAM::User`	is attached to	IAM group	
			IAM customer managed policy	
	`AWS::IAM::UserPolicy`	NA	NA	Resource metadata is included in the associated AWS::IAM::User CI
	`AWS::IAM::Group`	contains	IAM user	
		is attached to	IAM customer managed policy	
	`AWS::IAM::GroupPolicy`	NA	NA	Resource metadata is included in the associated AWS::IAM::Group CI
	`AWS::IAM::Role`	is attached to	IAM customer managed policy	
	`AWS::IAM::RolePolicy`	NA	NA	Resource metadata is included in the associated AWS::IAM::Role CI

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::IAM::Policy`	is attached to	IAM user	
			IAM group	
			IAM role	
	`AWS::IAM::SAMLProvider`	NA	NA	
	`AWS::IAM::ServerCertificate`	NA	NA	
	`AWS::IAM::InstanceProfile`	NA	NA	
	`AWS::IAM::OIDCProvider`	NA	NA	
AWS Identity and Access Management Access Analyzer	`AWS::AccessAnalyzer::Analyzer`	NA	NA	
AWS Identity and Access Management Roles Anywhere	`AWS::RolesAnywhere::Profile`	NA	NA	
	`AWS::RolesAnywhere::CRL`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::RolesAnywhere::TrustAnchor`	NA	NA	

AWS Config includes inline policies with the configuration details that it records. For more information on inline policies, see Managed policies and inline policies in the IAM User Guide.

AWS Identity Store

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Identity Store	`AWS::IdentityStore::Group`	NA	NA	

AWS IoT

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS IoT	`AWS::IoT::AccountAuditConfiguration`	NA	NA	
	`AWS::IoT::Authorizer`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	AWS::IoT::BillingGroup	NA	NA	
	AWS::IoT::CACertificate	NA	NA	
	AWS::IoT::CustomMetric	NA	NA	
	AWS::IoT::Dimension	NA	NA	
	AWS::IoT::DomainConfiguration	NA	NA	
	AWS::IoT::JobTemplate	NA	NA	
	AWS::IoT::MitigationAction	NA	NA	
	AWS::IoT::Policy	NA	NA	
	AWS::IoT::ProvisioningTemplate	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	AWS::IoT::RoleAlias	NA	NA	
	AWS::IoT::ResourceSpecificLogging	NA	NA	
	AWS::IoT::ScheduledAudit	NA	NA	
	AWS::IoT::SecurityProfile	NA	NA	
	AWS::IoT::SoftwarePackage	NA	NA	
	AWS::IoT::ThingGroup	NA	NA	
	AWS::IoT::TopicRule	NA	NA	
	AWS::IoT::TopicRuleDestination	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS IoT Wireless	`AWS::IoTWireless::Destination`	NA	NA	
	`AWS::IoTWireless::DeviceProfile`	NA	NA	
	`AWS::IoTWireless::FuotaTask`	NA	NA	
	`AWS::IoTWireless::ServiceProfile`	NA	NA	
	`AWS::IoTWireless::MulticastGroup`	NA	NA	
	`AWS::IoTWireless::NetworkAnalyzerConfiguration`	NA	NA	
	`AWS::IoTWireless::TaskDefinition`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::IoTWireless::WirelessGateway`	NA	NA	
AWS IoT Core	`AWS::IoT::FleetMetric`	NA	NA	
AWS IoT Core Device Advisor	`AWS::IoTCoreDeviceAdvisor::SuiteDefinition`	NA	NA	
AWS IoT Analytics	`AWS::IoTAnalytics::Datastore`	NA	NA	
	`AWS::IoTAnalytics::Dataset`	NA	NA	
	`AWS::IoTAnalytics::Pipeline`	NA	NA	
	`AWS::IoTAnalytics::Channel`	NA	NA	
AWS IoT Events	`AWS::IoTEvents::Input`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::IoTEvents::DetectorModel`	NA	NA	
	`AWS::IoTEvents::AlarmModel`	NA	NA	
AWS IoT TwinMaker	`AWS::IoTTwinMaker::Workspace`	NA	NA	
	`AWS::IoTTwinMaker::Entity`	NA	NA	
	`AWS::IoTTwinMaker::Scene`	NA	NA	
	`AWS::IoTTwinMaker::SyncJob`	NA	NA	
	`AWS::IoTTwinMaker::ComponentType`	NA	NA	
AWS IoT SiteWise	`AWS::IoTSiteWise::Asset`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::IoTSiteWise::AssetModel`	NA	NA	
	`AWS::IoTSiteWise::Dashboard`	NA	NA	
	`AWS::IoTSiteWise::Gateway`	NA	NA	
	`AWS::IoTSiteWise::Portal`	NA	NA	
	`AWS::IoTSiteWise::Project`	NA	NA	
AWS IoT Greengrass Version 2	`AWS::GreengrassV2::ComponentVersion`	NA	NA	

AWS Key Management Service

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Key Management Service	`AWS::KMS::Key`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::KMS::Alias`	NA	NA	

AWS Lambda

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Lambda	`AWS::Lambda::Function`	is associated with	IAM role	
			EC2 security group	
		is contained in	EC2 subnet	
	`AWS::Lambda::CodeSigningConfig`	NA	NA	

AWS Mainframe Modernization

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Mainframe Modernization	`AWS::M2::Environment`	NA	NA	

AWS Network Firewall

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Network Firewall	`AWS::NetworkFirewall::ContainerAssociation`	NA	NA	
	`AWS::NetworkFirewall::Firewall`	is attached to	EC2 Subnet	
		is associated with	NetworkFirewall FirewallPolicy	
	`AWS::NetworkFirewall::FirewallPolicy`	is associated with	NetworkFirewall RuleGroup	
	`AWS::NetworkFirewall::RuleGroup`	NA	NA	
	`AWS::NetworkFirewall::TLSInspectionConfiguration`	NA	NA	
	`AWS::NetworkFirewall::VpcEn`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	dpointAssociation			

AWS Network Manager

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Network Manager	AWS::NetworkManager::TransitGatewayRegistration	NA	NA	
	AWS::NetworkManager::Site	NA	NA	
	AWS::NetworkManager::Device	NA	NA	
	AWS::NetworkManager::Link	NA	NA	
	AWS::NetworkManager::GlobalNetwork	NA	NA	
	AWS::NetworkManage	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	r::CustomerGatewayAssociation			
	AWS::NetworkManager::LinkAssociation	NA	NA	
	AWS::NetworkManager::ConnectPeer	NA	NA	
	AWS::NetworkManager::TransitGatewayPeering	NA	NA	
	AWS::NetworkManager::CoreNetwork	NA	NA	

AWS Organizations

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Organizations	`AWS::Organizations::Account`	NA	NA	
	`AWS::Organizations::Organization`	NA	NA	
	`AWS::Organizations::OrganizationalUnit`	NA	NA	
	`AWS::Organizations::Policy`	NA	NA	
	`AWS::Organizations::ResourcePolicy`	NA	NA	

AWS HealthOmics

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS HealthOmics	`AWS::Omics::ReferenceStore`	NA	NA	

AWS Private Certificate Authority

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Private Certificate Authority	`AWS::ACMPCA::CertificateAuthority`	NA	NA	
	`AWS::ACMPCA::CertificateAuthorityActivation`	NA	NA	
AWS Private CA Connector for Active Directory	`AWS::PCAConnectorAD::Connector`	NA	NA	
	`AWS::PCAConnectorAD::DirectoryRegistration`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::PCAConnectorAD::Template`	NA	NA	Recording configuration items for resource deletion events might take up to 120 hours to reflect in AWS Config.
AWS Private CA Connector for SCEP	`AWS::PCAConnectorSCEP::Challenge`	NA	NA	Recording configuration items for resource deletion events might take up to 120 hours to reflect in AWS Config.
	`AWS::PCAConnectorSCEP::Connector`	NA	NA	Recording configuration items for resource deletion events might take up to 120 hours to reflect in AWS Config.

AWS Resilience Hub

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Resilience Hub	`AWS::ResilienceHub::ResiliencyPolicy`	NA	NA	
	`AWS::ResilienceHub::App`	NA	NA	

AWS Resource Explorer

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Resource Explorer	`AWS::ResourceExplorer2::Index`	NA	NA	
	`AWS::ResourceExplorer2::View`	NA	NA	

AWS Resource Groups

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Resource Groups	`AWS::ResourceGroups::Group`	NA	NA	

AWS Resource Access Manager

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Resource Access Manager	`AWS::RAM::ResourceShare`	NA	NA	

AWS RoboMaker

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS RoboMaker	`AWS::RoboMaker::RobotApplicationVersion`	NA	NA	
	`AWS::RoboMaker::RobotApplication`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::RoboMaker::SimulationApplication`	NA	NA	

AWS Signer

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Signer	`AWS::Signer::SigningProfile`	NA	NA	

AWS Secrets Manager

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Secrets Manager	`AWS::SecretsManager::Secret`	is associated with	Lambda function	
		is associated with	KMS Key	
	`AWS::SecretsManager::ResourcePolicy`	NA	NA	
	`AWS::SecretsManage`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`r::RotationSchedule`			

AWS Security Hub CSPM

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Security Hub CSPM	`AWS::SecurityHub::Standard`	NA	NA	

AWS Service Catalog

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Service Catalog	`AWS::ServiceCatalog::CloudFormationProduct`	is contained in	Portfolio	
		is associated with	CloudFormationProvisionedProduct	
	`AWS::ServiceCatalog::CloudFormationProvisionedProduct`	is associated with	Portfolio	
			CloudFormationProduct	
			CloudFormationStack	
	`AWS::ServiceCatalo`	contains	CloudFormationProduct	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`g::Portfolio`			

> **Note**
>
> When you use AWS Service Catalog with AWS Config, configuration items show the child provisioned product's ARN instead of the parent product's ARN. This happens when a AWS Service Catalog provisioned product serves as a resource within a parent provisioned product through CloudFormation. The resource ID remains trackable through the AWS Config interfaces.

AWS Shield

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Shield	`AWS::Shield::Protection`	is associated with	Amazon CloudFront distribution	
	`AWS::ShieldRegional::Protection`	is associated with	EC2 EIP	
		is associated with	ElasticLoadBalancing Balancer	
		is associated with	ElasticLoadBalancingV2 LoadBalancer	

AWS Step Functions

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Step Functions	`AWS::StepFunctions::Activity`	NA	NA	
	`AWS::StepFunctions::StateMachine`	NA	NA	

Amazon EventBridge Scheduler

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Amazon EventBridge Scheduler	`AWS::Scheduler::ScheduleGroup`	NA	NA	

AWS Systems Manager

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Systems Manager	`AWS::SSM::AssociationCompliance`	is associated with	Managed Instance Inventory	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::SSM::Document`	NA	NA	
	`AWS::SSM::FileData`	is associated with	Managed Instance Inventory	
	`AWS::SSM::ManagedInstanceInventory` *	is associated with	EC2 instance	
	`AWS::SSM::PatchBaseline`	is associated with	Managed Instance Inventory	
	`AWS::SSM::PatchCompliance`	is associated with	Managed Instance Inventory	
	`AWS::SSM::ResourceDataSync`	NA	NA	
AWS Systems Manager Incident Manager	`AWS::SSMIncidents::ResponsePlan`	NA	NA	
AWS Systems Manager Incident Manager Contacts	`AWS::SSMContacts::Contact`	NA	NA	

*To learn more about managed instance inventory, see Recording Software Configuration for Managed Instances.

AWS Transfer Family

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Transfer Family	`AWS::Transfer::Agreement`	NA	NA	
	`AWS::Transfer::Certificate`	NA	NA	
	`AWS::Transfer::Connector`	NA	NA	
	`AWS::Transfer::Profile`	NA	NA	
	`AWS::Transfer::Server`	NA	NA	
	`AWS::Transfer::User`	NA	NA	
	`AWS::Transfer::WebApp`	NA	NA	
	`AWS::Transfer::Workflow`	NA	NA	

AWS WAF

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS WAF	`AWS::WAF::RateBasedRule`	NA	NA	
	`AWS::WAF::Rule`	NA	NA	
	`AWS::WAF::WebACL`	is associated with	WAF Rule	
			WAF rate based rule	
			WAF Rulegroup	
	`AWS::WAF::RuleGroup`	is associated with	WAF Rule	
	`AWS::WAFRegional::RateBasedRule`	NA	NA	
	`AWS::WAFRegional::Rule`	NA	NA	
	`AWS::WAFRegional::WebACL`	is associated with	ElasticLoadBalancingV2 LoadBalancer	
			WAFRegional Rule	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
			WAFRegional rate based rule	
			WAFRegional Rulegroup	
	`AWS::WAFRegional::RuleGroup`	is associated with	WAFRegional Rule	
AWS WAF V2	`AWS::WAFv2::WebACL`	is associated with	ElasticLoadBalancingV2 LoadBalancer	
			ApiGateway Stage	
			WAFv2 IPSet	
			WAFv2 RegexPatternSet	
			WAFv2 RuleGroup	
			WAFv2 ManagedRuleSet	
	`AWS::WAFv2::RuleGroup`	is associated with	WAFv2 IPSet	
			WAFv2 RegexPatternSet	
	`AWS::WAFv2::ManagedRuleSet`	is associated with	WAFv2 RuleGroup	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::WAFv2::IPSet`	NA	NA	
	`AWS::WAFv2::RegexPatternSet`	NA	NA	

AWS X-Ray

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS X-Ray	`AWS::XRay::EncryptionConfig`	NA	NA	
	`AWS::XRay::Group`	NA	NA	
	`AWS::XRay::ResourcePolicy`	NA	NA	
	`AWS::XRay::SamplingRule`	NA	NA	

Elastic Load Balancing

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
Elastic Load Balancing	Application Load Balancer `AWS::ElasticLoadBalancingV2::LoadBalancer`	is associated with	EC2 security group	
		is attached to	Subnet	
		is contained in	Virtual private cloud (VPC)	
	Application Load Balancer Listener `AWS::ElasticLoadBalancingV2::Listener`	NA	NA	
	Application Load Balancer Target Group `AWS::ElasticLoadBalancingV2::TargetGroup`	NA	NA	
	Application Load Balancer Listener Rule	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`AWS::ElasticLoadBalancingV2::ListenerRule`			
	Classic Load Balancer `AWS::ElasticLoadBalancing::LoadBalancer`	is associated with	EC2 security group	
		is attached to	Subnet	
		is contained in	Virtual private cloud (VPC)	
	Network Load Balancer `AWS::ElasticLoadBalancingV2::LoadBalancer`	NA	NA	

AWS Elemental MediaConnect

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Elemental MediaConnect	`AWS::MediaConnect::Bridge`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	AWS::MediaConnect::FlowEntitlement	NA	NA	
	AWS::MediaConnect::FlowVpcInterface	NA	NA	
	AWS::MediaConnect::FlowSource	NA	NA	
	AWS::MediaConnect::Gateway	NA	NA	

AWS Elemental MediaLive

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Elemental MediaLive	AWS::MediaLive::CloudWatchAlarmTemplate	NA	NA	
	AWS::MediaLive::CloudWatchA	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`larmTemplateGroup`			
	`AWS::MediaLive::EventBridgeRuleTemplate`	NA	NA	
	`AWS::MediaLive::EventBridgeRuleTemplateGroup`	NA	NA	

AWS Elemental MediaPackage

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Elemental MediaPackage	`AWS::MediaPackage::PackagingGroup`	NA	NA	
	`AWS::MediaPackage::PackagingConfiguration`	NA	NA	

AWS Elemental MediaPackage V2

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Elemental MediaPackage V2	`AWS::MediaPackageV2::Channel`	NA	NA	
	`AWS::MediaPackageV2::ChannelGroup`	NA	NA	
	`AWS::MediaPackageV2::OriginEndpoint`	NA	NA	

AWS Elemental MediaTailor

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
AWS Elemental MediaTailor	`AWS::MediaTailor::Channel`	NA	NA	
	`AWS::MediaTailor::LiveSource`	NA	NA	
	`AWS::MediaTailor::PlaybackC`	NA	NA	

AWS Service	Resource Type Value	Relationship	Related Resource	Notes
	`onfiguration`			
	`AWS::MediaTailor::SourceLocation`	NA	NA	

Resource Coverage by Region Availability

Recording AWS Resources with AWS Config

AWS Config continuously detects when supported resource types are created, changed, or deleted. AWS Config records these events as configuration items (CIs).

You can customize AWS Config to record configuration changes for all supported resource types, or for only the supported resource types that are relevant to you. For a list of supported resource types that AWS Config can record, see Supported Resource Types for AWS Config.

Topics

- Considerations
- What are the differences between Regional and global resources?
- AWS Config Rules and global resource types
- Recording frequency for AWS Config
- Non-recorded resources
- Recording resources in the AWS Config console
- Recording resources with the AWS CLI
- Excluding resources from recording with AWS Config
- Stopping AWS Config from recording with the customer managed configuration recorder

Considerations

High Number of AWS Config Evaluations

You might notice increased activity in your account during your initial month recording with AWS Config when compared to subsequent months. During the initial bootstrapping process, AWS Config runs evaluations on all the resources in your account that you have selected for AWS Config to record.

If you are running ephemeral workloads, you may see increased activity from AWS Config as it records configuration changes associated with creating and deleting these temporary resources. An *ephemeral workload* is a temporary use of computing resources that are loaded and run when needed. Examples include Amazon Elastic Compute Cloud (Amazon EC2) Spot Instances, Amazon EMR jobs, and AWS Auto Scaling.

If you want to avoid the increased activity from running ephemeral workloads, you can set up the customer managed configuration recorder to exclude these resource types from being recorded, or run these types of workloads in a separate account with AWS Config turned off to avoid increased configuration recording and rule evaluations.

Region availability

Before specifying a resource type for AWS Config to track, check Resource Coverage by Region availability to see if the resource type is supported in the AWS Region where you set up AWS Config.

If a resource type is supported by AWS Config in at least one Region, you can enable the recording of that resource type in all Regions supported by AWS Config, even if the specified resource type is not supported in the AWS Region where you set up AWS Config.

What are the differences between Regional and global resources?

Regional resources

Regional resources are tied to a Region and can be used only in that Region. You create them in a specified AWS Region, and then they exist in that Region. To see or interact with those resources, you must direct your operations to that Region. For example, to create an Amazon EC2 instance with the AWS Management Console, you choose the AWS Region that you want to create the instance in. If you use the AWS Command Line Interface (AWS CLI) to create the instance, then you include the `--region` parameter. The AWS SDKs each have their own equivalent mechanism to specify the Region that the operation uses.

There are several reasons for using Regional resources. One reason is to ensure that the resources, and the service endpoints that you use to access them, are as close to the customer as possible. This improves performance by minimizing latency. Another reason is to provide an isolation boundary. This lets you create independent copies of resources in multiple Regions to distribute the load and improve scalability. At the same time, it isolates the resources from each other to improve availability.

If you specify a different AWS Region in the console or in an AWS CLI command, then you can no longer see or interact with the resources you could see in the previous Region.

When you look at the Amazon Resource Name (ARN) for a Regional resource, the Region that contains the resource is specified as the fourth field in the ARN. For example, an Amazon EC2 instance is a Regional resource. The following is an example of an ARN for a Amazon EC2 instance that exists in the `us-east-1` Region.

```
arn:aws:ec2:us-east-1:123456789012:instance/i-0a6f30921424d3eee
```

Global resources

Some AWS services resources are *global resources*, meaning that you can use the resource from ***anywhere***. You don't specify an AWS Region in a global service's console. To access a global resource, you don't specify a `--region` parameter when using the service's AWS CLI and AWS SDK operations.

Global resources support cases where it is critical that only one instance of a particular resource can exist at a time. In these scenarios, replication or synchronization between copies in different Regions is not adequate. Having to access a single global endpoint, with the possible increase in latency, is considered acceptable to ensure that any changes are instantaneously visible to consumers of the resource.

For example, Amazon Aurora global clusters (`AWS::RDS::GlobalCluster`) are global resources, and therefore not tied to a Region. This means that you can create a global cluster without relying on a regional endpoint. The benefit is that, while the Amazon Relational Database Service (Amazon RDS) itself is organized by Regions, the specific Region where a global cluster originates doesn't impact the global cluster. It appears as a single, continuous global cluster across all Regions.

The Amazon Resource Name (ARN) for a global resource doesn't include a Region. The fourth field is empty, such as in the following example of an ARN for a global cluster.

```
arn:aws:rds::123456789012:global-cluster:test-global-cluster
```

> **Important**
>
> Global resource types onboarded to AWS Config after February 2022 will only be recorded in the service's home Region for the commercial partition and AWS GovCloud (US-West) for the GovCloud partition. You can view the configuration items (CIs) for these new global resource types only in their home Region and AWS GovCloud (US-West).
>
> Global resource types onboarded before February 2022 (`AWS::IAM::Group`, `AWS::IAM::Policy`, `AWS::IAM::Role`, and `AWS::IAM::User`) remain unchanged. You can enable the recording of these global IAM resources in all Regions where AWS Config was supported before February 2022. These global IAM resources cannot be recorded in Regions supported by AWS Config after February 2022.

Global resource types | IAM resources

The following IAM resource types are global resources: IAM users, groups, roles, and customer managed policies. These resource types can be recorded by AWS Config in Regions where AWS Config was available before February 2022. This list where you cannot record the global IAM resource types includes the following Regions: Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE).

To prevent duplicate configuration items (CIs), you should consider only recording the global IAM resource types one time in one of the supported Regions. This can also help you avoid unneccessary evaluations and API throttling.

Global resource types | Home Region Only

Global resources for the following services are only recorded by AWS Config in the home Region of the global resource type: Amazon Elastic Container Registry Public, AWS Global Accelerator, Amazon Route 53, Amazon CloudFront, and AWS WAF. For these global resources, the same instance of the resource type can be used in multiple AWS Regions, but the configuration items (CIs) are only recorded in the home Region for the commercial partition or AWS GovCloud (US-West) for the AWS GovCloud (US) partition.

Home Regions for Global Resource Types

AWS Service	Resource Type Value	Home Region
Amazon Elastic Container Registry Public	`AWS::ECR::PublicRepository`	US East (N. Virginia) Region
AWS Global Accelerator	`AWS::GlobalAccelerator::Listener`	US West (Oregon) Region
	`AWS::GlobalAccelerator::EndpointGroup`	US West (Oregon) Region
	`AWS::GlobalAccelerator::Accelerator`	US West (Oregon) Region
Amazon Route 53	`AWS::Route53::HostedZone`	US East (N. Virginia) Region

AWS Service	Resource Type Value	Home Region
	`AWS::Route53::HealthCheck`	US East (N. Virginia) Region
Amazon CloudFront	`AWS::CloudFront::Distribution`	US East (N. Virginia) Region
AWS WAF	`AWS::WAFv2::WebACL`	US East (N. Virginia) Region

Global resource types | Aurora global clusters

`AWS::RDS::GlobalCluster` is a global resource that is recorded in all supported AWS Config Regions where the customer managed configuration recorder is enabled. This global resource type is unique in that if you enable the recording of this resource in one Region, AWS Config will record configuration items (CIs) for this resource type in all your enabled Regions.

If you do not want to record `AWS::RDS::GlobalCluster` in all enabled Regions, use one of the following recording strategies for the AWS Config console:

- **Record all resource types with customizable overrides**, choose "AWS RDS GlobalCluster", and choose the override "Exclude from recording"
- **Record specific resource types**.

If you do not want to record `AWS::RDS::GlobalCluster` in all enabled Regions, use one of the following recording strategies for the API/CLI:

- **Record all current and future resource types with exclusions** (`EXCLUSION_BY_RESOURCE_TYPES`)
- **Record specific resource types** (`INCLUSION_BY_RESOURCE_TYPES`).

AWS Config Rules and global resource types

The global IAM resource types onboarded before February 2022 (`AWS::IAM::Group`, `AWS::IAM::Policy`, `AWS::IAM::Role`, and `AWS::IAM::User`) can only be recorded by AWS Config in Regions where AWS Config was available before February 2022. These global IAM resource types cannot be recorded in Regions supported by AWS Config after February 2022. For a list of those Regions, see Recording AWS Resources | Global Resources.

If you record a global IAM resource type in at least one Region, periodic rules that report compliance on the global IAM resource type will run evaluations in all Regions where the periodic rule is added, even if you have not enabled the recording of the global IAM resource type in the Region where the periodic rule was added.

Best Practices for reporting compliance on global resources onboarded before February 2022

To avoid unnecessary evaluations, you should only deploy AWS Config rules and conformance packs that have these global resources in scope to one of the supported Regions. For a list of which managed rules are supported in which Regions, see List of AWS Config Managed Rules by Region Availability. This applies to AWS Config rules, organizational AWS Config rules, and also rules created by other AWS services, such as AWS Security Hub CSPM and AWS Control Tower.

If you are not recording global resource types onboarded before February 2022, it is recommended that you do not enable the following periodic rules to avoid unnecessary evaluations:

- access-keys-rotated
- account-part-of-organizations
- iam-password-policy
- iam-policy-in-use
- iam-root-access-key-check
- iam-user-mfa-enabled
- iam-user-unused-credentials-check
- mfa-enabled-for-iam-console-access
- root-account-hardware-mfa-enabled
- root-account-mfa-enabled

Best Practices for reporting compliance on global resources onboarded after February 2022

Global resource types onboarded to AWS Config recording after February 2022 will be recorded only in the service's home Region for the commercial partition and AWS GovCloud (US-West) for the AWS GovCloud (US) partition. You should deploy AWS Config rules and conformance packs that have these global resources in scope only to the resource type's home Region. For more information, see Home Regions for Global Resource Types.

Recording frequency for AWS Config

AWS Config supports *Continuous recording* and *Daily recording*. Continuous recording allows you to record configuration changes continuously whenever a change occurs. Daily recording allows you to receive a configuration item (CI) representing the most recent state of your resources over the last 24-hour period, only if it's different from the previous CI recorded. For steps on how to change the recording frequency, see Changing Recording Frequency.

Continuous recording

Some benefits of continuous recording include:

- **Real-time Monitoring**: Continuous recording can provide immediate detection for unauthorized changes or unexpected alterations, which can enhance your security and compliance efforts.
- **Detailed Analysis**: Continuous recording can allow you to perfom in-depth analysis of configuration changes to your resources as they occur, which can allow you to identify patterns and trends in the moment.

Daily recording

Some benefits of daily recording include:

- **Minimal Disruption**: Daily recording can provide you with a more mangeable flow of information, which can reduce the frequency of notifications and alert fatigue.
- **Cost Efficiency**: Daily recording can provide you with the flexibility to record changes to your resources at at a lower frequency, which can reduce costs related to the number of configuration changes recorded.

> **Note**
>
> AWS Firewall Manager depends on continuous recording to monitor your resources. If you are using Firewall Manager, it is recommended that you set the recording frequency to Continuous.

Non-recorded resources

If a resource is not recorded, AWS Config captures only the creation and deletion of that resource, and no other details, at no cost to you. When a non-recorded resource is created or deleted, AWS Config sends a notification, and it displays the event on the resource details page. The details page for a non-recorded resource provides null values for most configuration details, and it does not provide information about relationships and configuration changes.

The relationship information that AWS Config provides for recorded resources is not limited because of missing data for non-recorded resources. If a recorded resource is related to a non-recorded resource, that relationship is provided in the details page of the recorded resource.

IAM resource type considerations

The `AWS::IAM::User`, `AWS::IAM::Policy`, `AWS::IAM::Group`, `AWS::IAM::Role` resource types will only capture the creation (`ResourceNotRecorded`) and deletion (`ResourceDeletedNotRecorded`) states if the resource is, or previously was, selected as a resource to record in the customer managed configuration recorder .

CI recording schedule for non-recorded resources

The configuration items (CIs) for `ResourceNotRecorded` and `ResourceDeletedNotRecorded` do not follow the typical recording time for resource types. These resource types are only recorded during the periodic baselining process for the customer managed configuration recorder, which is at a less frequent cadance than that for the other resource types. This means that create and delete notifications are not sent upon creation or deletion, but during the baselining process.

CI delivery and service-linked recorder scope

For service-linked configuration recorders, the recording scope determines if you receive configuration items (CIs) in the delivery channel. The recording scope is set by the service that is linked to the configuration recorder. If the recording scope is internal, you will not receive CIs in the delivery channel.

Recording resources in the AWS Config console

You can use the AWS Config console to select the types of resources that AWS Config records with the customer managed configuration recorder.

To select resources

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Choose **Settings** in the left navigation pane.
3. On the **Customer managed recorder** tab, choose **Edit**.
4. In the **Recording method** section, choose a recording strategy. You can specify the AWS resources that you want AWS Config to record.

   All resource types with customizable overrides

   Set up AWS Config to record configuration changes for all current and future supported resource types in this Region. You can override the recording frequency for specific resource types or exclude specific resource types from recording. For more information, see Supported Resource Types.

   - **Default settings**

     Configure the default recording frequency for all current and future supported resource types. For more information see, Recording Frequency.

     - Continuous recording – AWS Config will record configuration changes continuously whenever a change occurs.
     - Daily recording – You will receive a configuration item (CI) representing the most recent state of your resources over the last 24-hour period, only if it's different from the previous CI recorded.

     > **Note**
     >
     > AWS Firewall Manager depends on continuous recording to monitor your resources. If you are using Firewall Manager, it is recommended that you set the recording frequency to Continuous.

   - **Override settings**

     Override the recording frequency for specific resource types, or exclude specific resource types from recording. If you change the recording frequency for a resource type or stop recording a resource type, the configuration items that were already recorded will remain unchanged.

Specific resource types

Set up AWS Config to record configuration changes for only the resource types that you specify.

- **Specific resource types**

  Choose a resource type to record and its frequency. For more information see, Recording Frequency.

  - Continuous recording – AWS Config will record configuration changes continuously whenever a change occurs.
  - Daily recording – You will receive a configuration item (CI) representing the most recent state of your resources over the last 24-hour period, only if it's different from the previous CI recorded.

  > **Note**
  >
  > AWS Firewall Manager depends on continuous recording to monitor your resources. If you are using Firewall Manager, it is recommended that you set the recording frequency to Continuous.

  If you change the recording frequency for a resource type or stop recording a resource type, the configuration items that were already recorded will remain unchanged.

5. Choose **Save** to save your changes.

Considerations When Recording Resources

High Number of AWS Config Evaluations

You might notice increased activity in your account during your initial month recording with AWS Config when compared to subsequent months. During the initial bootstrapping process, AWS Config runs evaluations on all the resources in your account that you have selected for AWS Config to record.

If you are running ephemeral workloads, you may see increased activity from AWS Config as it records configuration changes associated with creating and deleting these temporary resources.

An *ephemeral workload* is a temporary use of computing resources that are loaded and run when needed. Examples include Amazon Elastic Compute Cloud (Amazon EC2) Spot Instances, Amazon EMR jobs, and AWS Auto Scaling. . If you want to avoid the increased activity from running ephemeral workloads, you can set up the customer managed configuration recorder to exclude these resource types from being recorded, or run these types of workloads in a separate account with AWS Config turned off to avoid increased configuration recording and rule evaluations.

Considerations: All resource types with customizable overrides

Globally recorded resource types | Aurora global clusters are initially included in recording

The `AWS::RDS::GlobalCluster` resource type will be recorded in all supported AWS Config Regions where the customer managed configuration recorder is enabled.

If you do not want to record `AWS::RDS::GlobalCluster` in all enabled Regions, choose "AWS RDS GlobalCluster", and choose the override "Exclude from recording".

Global resource types | IAM resource types are initially excluded from recording

The global IAM resource types are initially excluded from recording to help you reduce costs. This bundle includes IAM users, groups, roles, and customer managed policies. Choose **Remove** to remove the override and include these resources in your recording.

Additionally, the global IAM resource types (`AWS::IAM::User`, `AWS::IAM::Group`, `AWS::IAM::Role`, and `AWS::IAM::Policy`) cannot be recorded in Regions supported by AWS Config after February 2022. For a list of those Regions, see Recording AWS Resources | Global Resources.

Limits

You can add up to 100 frequency overrides and 600 exclusion overrides.

Daily recording is not supported for the following resource types:

- `AWS::Config::ResourceCompliance`
- `AWS::Config::ConformancePackCompliance`
- `AWS::Config::ConfigurationRecorder`

Considerations: Specific resource types

Region Availability

Before specifying a resource type for AWS Config to track, check Resource Coverage by Region Availability to see if the resource type is supported in the AWS Region where you set up AWS Config. If a resource type is supported by AWS Config in at least one Region, you can enable the recording of that resource type in all Regions supported by AWS Config, even if the specified resource type is not supported in the AWS Region where you set up AWS Config.

Limits

No limits if all resource types have the same frequency. You can add up to 100 resource types with Daily frequency if at least one resource type is set to Continuous.

The Daily frequency is not supported for the following resource types:

- `AWS::Config::ResourceCompliance`
- `AWS::Config::ConformancePackCompliance`
- `AWS::Config::ConfigurationRecorder`

Recording resources with the AWS CLI

You can use the AWS CLI to select the types of resources that you want AWS Config to record. You do this by creating a customer managed configuration recorder, which records the types of resources that you specify in a recording group. In the recording group, you specify whether you want to record all supported resource types, or to include or exclude specific types of resources.

Record all current and future supported resource types

Set up AWS Config to record configuration changes for all current and future supported resource types in this Region. For a list of supported resources types, see Supported Resource Types.

1. Use the `put-configuration-recorder` command:

   This command uses the `--configuration-recorder` and `---recording-group` fields.

   ```
   $ aws configservice put-configuration-recorder \
   --configuration-recorder file://configurationRecorder.json \
   --recording-group file://recordingGroup.json
   ```

   The `configuration-recorder` field

The `configurationRecorder.json` file specifies name and `roleArn` as well as the default recording frequency for the configuration recorder (`recordingMode`).

```
{
  "name": "default",
  "roleARN": "arn:aws:iam::123456789012:role/config-role",
  "recordingMode": {
    "recordingFrequency": CONTINUOUS or DAILY,
    "recordingModeOverrides": [
        {
            "description": "Description you provide for the override",
            "recordingFrequency": CONTINUOUS or DAILY,
            "resourceTypes": [ Comma-separated list of resource types to include
 in the override ]
        }
    ]
  }
}
```

The `recording-group` field

The `recordingGroup.json` file specifies which resource types are recorded.

```
{
    "allSupported": true,
    "recordingStrategy": {
        "useOnly": "ALL_SUPPORTED_RESOURCE_TYPES"
    },
    "includeGlobalResourceTypes": true
}
```

For more information about these fields, see `put-configuration-recorder` in the *AWS CLI Command Reference*.

2. (Optional) To verify that your customer managed configuration recorder has the settings that you want, use the following `describe-configuration-recorders` command.

```
$ aws configservice describe-configuration-recorders
```

The following is an example response.

```
{
    "ConfigurationRecorders": [
        {
            "name": "default"
            "recordingGroup": {
                "allSupported": true,
                "exclusionByResourceTypes": {
                     "resourceTypes": []
                },
                "includeGlobalResourceTypes": true,
                "recordingStrategy": {
                    "useOnly": "ALL_SUPPORTED_RESOURCE_TYPES"
                },
                "resourceTypes": [],
            },
            "recordingMode": {
                "recordingFrequency": CONTINUOUS or DAILY,
                "recordingModeOverrides": [
                 {
                     "description": "Description you provide for the override,
                     "recordingFrequency": CONTINUOUS or DAILY,
                     "resourceTypes": [ Comma-separated list of resource types
 to include in the override]
                }
              ]
            },
            "roleARN": "arn:aws:iam::123456789012:role/config-role"
        }
    ]
}
```

Record all current and future supported resources types excluding the types you specify

Set up AWS Config to record configuration changes for all current and future supported resource types, including global resource types, except the resource types that you specify to exclude from recording.

If you choose to stop recording for a resource type, the configuration items that were already recorded will remain unchanged. For a list of supported resources types, see Supported Resource Types.

1. Use the `put-configuration-recorder` command:

   This command uses the `--configuration-recorder` and `---recording-group` fields.

```
$ aws configservice put-configuration-recorder \
--configuration-recorder file://configurationRecorder.json \
--recording-group file://recordingGroup.json
```

The `configuration-recorder` field

The `configurationRecorder.json` file specifies `name` and `roleArn` as well as the default recording frequency for the configuration recorder (`recordingMode`).

```
{
  "name": "default",
  "roleARN": "arn:aws:iam::123456789012:role/config-role",
  "recordingMode": {
    "recordingFrequency": CONTINUOUS or DAILY,
    "recordingModeOverrides": [
        {
            "description": "Description you provide for the override",
            "recordingFrequency": CONTINUOUS or DAILY,
            "resourceTypes": [ Comma-separated list of resource types to include
 in the override ]
        }
    ]
  }
}
```

The `recording-group` field

The `recordingGroup.json` file specifies which types of resources AWS Config will record. Pass one or more resource types to exclude in the `resourceTypes` field of `exclusionByResourceTypes`, as shown in the following example.

```
{
    "allSupported": false,
    "exclusionByResourceTypes": {
        "resourceTypes": [
            "AWS::Redshift::ClusterSnapshot",
            "AWS::RDS::DBClusterSnapshot",
```

```
            "AWS::CloudFront::StreamingDistribution"
        ]
    },
   "includeGlobalResourceTypes": false,
   "recordingStrategy": {
       "useOnly": "EXCLUSION_BY_RESOURCE_TYPES"
    },

}
```

For more information about these fields, see `put-configuration-recorder` in the *AWS CLI Command Reference*.

2. (Optional) To verify that your customer managed configuration recorder has the settings that you want, use the following `describe-configuration-recorders` command.

```
$ aws configservice describe-configuration-recorders
```

The following is an example response.

```
{
    "ConfigurationRecorders": [
        {
            "name": "default",
            "recordingGroup": {
                "allSupported": false,
                "exclusionByResourceTypes": {
                    "resourceTypes": [
                        "AWS::Redshift::ClusterSnapshot",
                        "AWS::RDS::DBClusterSnapshot",
                        "AWS::CloudFront::StreamingDistribution"
                    ]
                },
                "includeGlobalResourceTypes": false,
                "recordingStrategy": {
                    "useOnly": "EXCLUSION_BY_RESOURCE_TYPES"
                },
                "resourceTypes": [],
            },
            "recordingMode": {
                "recordingFrequency": CONTINUOUS or DAILY,
                "recordingModeOverrides": [
```

```
                 {
                     "description": "Description you provide for the override,
                     "recordingFrequency": CONTINUOUS or DAILY,
                     "resourceTypes": [ Comma-separated list of resource types to
 include in the override]
                 }
               ]
             },
             "roleARN": "arn:aws:iam::123456789012:role/config-role"
         }
     ]
}
```

Record specific resource types

Set up AWS Config to record configuration changes for only the resource types that you specify.

If you choose to stop recording for a resource type, the configuration items that were already recorded will remain unchanged. For a list of supported resources types, see Supported Resource Types.

1. Use the `put-configuration-recorder` command:

   This command uses the `--configuration-recorder` and `---recording-group` fields.

```
$ aws configservice put-configuration-recorder \
--configuration-recorder file://configurationRecorder.json \
--recording-group file://recordingGroup.json
```

The `configuration-recorder` field

The `configurationRecorder.json` file specifies `name` and `roleArn` as well as the default recording frequency for the configuration recorder (`recordingMode`).

```
{
  "name": "default",
  "roleARN": "arn:aws:iam::123456789012:role/config-role",
  "recordingMode": {
    "recordingFrequency": CONTINUOUS or DAILY,
    "recordingModeOverrides": [
        {
```

```
            "description": "Description you provide for the override",
            "recordingFrequency": CONTINUOUS or DAILY,
            "resourceTypes": [ Comma-separated list of resource types to include
 in the override ]
        }
    ]
  }
}
```

The `recording-group` field

The `recordingGroup.json` file specifies which types of resources AWS Config will record. Pass one or more resource types to exclude in the `resourceTypes` field as shown in the following example.

```
{
    "allSupported": false,
    "recordingStrategy": {
        "useOnly": "INCLUSION_BY_RESOURCE_TYPES"
    },
    "includeGlobalResourceTypes": false,
    "resourceTypes": [
        "AWS::EC2::EIP",
        "AWS::EC2::Instance",
        "AWS::EC2::NetworkAcl",
        "AWS::EC2::SecurityGroup",
        "AWS::CloudTrail::Trail",
        "AWS::EC2::Volume",
        "AWS::EC2::VPC",
        "AWS::IAM::User",
        "AWS::IAM::Policy"
  ]
}
```

For more information about these fields, see `put-configuration-recorder` in the *AWS CLI Command Reference*.

2. (Optional) To verify that your customer managed configuration recorder has the settings that you want, use the following `describe-configuration-recorders` command.

```
$ aws configservice describe-configuration-recorders
```

The following is an example response.

```
{
    "ConfigurationRecorders": [
        {
            "name": "default",
            "recordingGroup": {
                "allSupported": false,
                "exclusionByResourceTypes": {
                    "resourceTypes": []
                },
                "includeGlobalResourceTypes": false
                "recordingStrategy": {
                    "useOnly": "INCLUSION_BY_RESOURCE_TYPES"
                },
                "resourceTypes": [
                    "AWS::EC2::EIP",
                    "AWS::EC2::Instance",
                    "AWS::EC2::NetworkAcl",
                    "AWS::EC2::SecurityGroup",
                    "AWS::CloudTrail::Trail",
                    "AWS::EC2::Volume",
                    "AWS::EC2::VPC",
                    "AWS::IAM::User",
                    "AWS::IAM::Policy"
                ]
            },
            "recordingMode": {
                "recordingFrequency": CONTINUOUS or DAILY,
                "recordingModeOverrides": [
                 {
                     "description": "Description you provide for the override,
                     "recordingFrequency": CONTINUOUS or DAILY,
                     "resourceTypes": [ Comma-separated list of resource types to
 include in the override]
                }
              ]
            },
            "roleARN": "arn:aws:iam::123456789012:role/config-role"
        }
    ]
}
```

Excluding resources from recording with AWS Config

AWS Config allows you to exclude specific types of AWS resources from inventory tracking and compliance monitoring while still tracking all other supported resource types currently available in AWS Config, including those that will be added in the future. You can use this feature to concentrate on critical resources that are subject to your compliance and governance standards.

Excluding resources (Console)

If you do not want to record an AWS resource type, use one of the following recording strategies for the AWS Config console:

- **Record all resource types with customizable overrides**, choose the resource type you want to exclude, and choose the override "Exclude from recording"
- **Record specific resource types**.

For more detailed steps, see Recording resources (Console).

Excluding resources (AWS CLI)

If you do not want to record an AWS resource type, use one of the following recording strategies for the API/CLI:

- **Record all current and future resource types with exclusions** (`EXCLUSION_BY_RESOURCE_TYPES`)
- **Record specific resource types** (`INCLUSION_BY_RESOURCE_TYPES`).

For more detailed steps, see Recording Resources (AWS CLI).

Stopping AWS Config from recording with the customer managed configuration recorder

You can stop AWS Config from recording with the customer managed configuration recorder any time. After AWS Config stops recording a resource, it retains the configuration information that was previously captured, and you can continue to access this information.

For steps on how to stop recording, see Stopping the customer managed configuration recorder.

Recording Configurations with AWS Config for Third-Party Resources using the AWS CLI

Record configurations for third-party resources or custom resource types such as on premise servers, SAAS monitoring tools, and version control systems (like GitHub).

You can publish the configuration data of third-party resources into AWS Config and view and monitor the resource inventory and configuration history using the AWS Config console and APIs. You can use AWS Config to manage all your resources and evaluate resource configuration for compliance against best practices using AWS Config rules. You can also create AWS Config rules or conformance packs to evaluate these third-party resources against best practices, internal policies, and regulatory policies.

> **Note**
>
> If you have configured AWS Config to record all resource types, then third-party resources that are managed (created, updated, or deleted) through CloudFormation are automatically tracked in AWS Config as configuration items.

Prerequisite: The third-party resources or custom resource type must be registered using CloudFormation.

Topics

- Adding Third-Party Resources to AWS Config
- Record Configuration Items with AWS Config for Third-Party Resources using the AWS CLI
- Read Configuration Items with AWS Config for Third-Party Resources using the AWS CLI
- Delete Third-Party Resources from AWS Config using the AWS CLI

Adding Third-Party Resources to AWS Config

Follow these steps to add a third-party resource to AWS Config.

Topics

- Step 1: Setup Your Development Environment
- Step 2: Model Your Resource

- Step 3: Generate Artifacts
- Step 4: Register Your Resource
- Step 5: Publish Resource Configuration

Step 1: Setup Your Development Environment

Install and configure the CloudFormation AWS CLI. The AWS CLI allows you to model and register your custom resources. For more information, see Custom Resources and What Is the CloudFormation Command Line Interface?.

Step 2: Model Your Resource

Create a resource provider schema that conforms to and validates the configuration of the resource type.

1. Use the `init` command to create your resource provider project and generate the files it requires.

```
$ cfn init
Initializing new project
```

2. The `init` command launches a wizard that walks you through setting up the project, including specifying the resource name. For this walkthrough, specify `MyCustomNamespace::Testing::WordPress`.

```
Enter resource type identifier (Organization::Service::Resource):
 MyCustomNamespace::Testing::WordPress
```

3. Enter a package name for your resource.

```
Enter a package name (empty for default 'com.custom.testing.wordpress'):
 com.custom.testing.wordpress
Initialized a new project in /workplace/user/custom-testing-wordpress
```

> **Note**
>
> In order to guarantee that any project dependencies are correctly resolved, you can import the generated project into your IDE with Maven support.
> For example, if you are using IntelliJ IDEA, you would need to do the following:

- From the **File** menu, choose **New**, then choose **Project From Existing Sources**.
- Navigate to the project directory
- In the **Import Project** dialog box, choose **Import project from external model** and then choose **Maven**.
- Choose **Next** and accept any defaults to complete importing the project.

4. Open the `mycustomnamespace-testing-wordpress.json` file that contains the schema for your resource. Copy and paste the following schema into `mycustomnamespace-testing-wordpress.json`.

```
{
  "typeName": "MyCustomNamespace::Testing::WordPress",
  "description": "An example resource that creates a website based on WordPress
 5.2.2.",
  "properties": {
    "Name": {
      "description": "A name associated with the website.",
      "type": "string",
      "pattern": "^[a-zA-Z0-9]{1,219}\\Z",
      "minLength": 1, "maxLength": 219
    },
    "SubnetId": {
      "description": "A subnet in which to host the website.",
      "pattern": "^(subnet-[a-f0-9]{13})|(subnet-[a-f0-9]{8})\\Z",
      "type": "string"
    },
    "InstanceId": {
      "description": "The ID of the instance that backs the WordPress site.",
      "type": "string"
    },
    "PublicIp": {
      "description": "The public IP for the WordPress site.",
      "type": "string"
    }
  },
  "required": [ "Name", "SubnetId" ],
  "primaryIdentifier": [ "/properties/PublicIp", "/properties/InstanceId" ],
  "readOnlyProperties": [ "/properties/PublicIp", "/properties/InstanceId" ],
  "additionalProperties": false
}
```

5. Validate the schema.

```
$ cfn validate
```

6. Update the auto-generated files in the resource provider package to view the resource provider schema updates. Upon initiation of the resource provider project, the AWS CLI generates supporting files and code for the resource provider. Regenerate the code to see the updated schema.

```
$ cfn generate
```

> **Note**
>
> When using Maven, as part of the build process the `generate` command is automatically run before the code is compiled. So your changes will never get out of sync with the generated code.
> Be aware the CloudFormation CLI must be in a location Maven/the system can find. For more information, see Setting up your environment for developing extensions.

For more information on the whole process, see Modeling Resource Providers for Use in CloudFormation.

Step 3: Generate Artifacts

Run the following command to generate artifacts for `cfn submit`.

```
$ mvn package
```

Step 4: Register Your Resource

AWS Config does not require resource provider handlers to perform configuration tracking for your resource. Run the following command to register your resource.

```
$ cfn submit
```

For more information, see Registering Resource Providers for Use in CloudFormation Templates.

Step 5: Publish Resource Configuration

Determine the configuration for MyCustomNamespace::Testing::WordPress.

```
{
  "Name": "MyWordPressSite",
  "SubnetId": "subnet-abcd0123",
  "InstanceId": "i-01234567",
  "PublicIp": "my-wordpress-site.com"
}
```

Determine the schema version id from CloudFormation `DescribeType`.

In AWS Config, you can see see if this resource configuration is accepted. To evaluate compliance you can write AWS Config rules using this resource.

(Optional) To automate recording of configuration, implement periodic or change-based configuration collectors.

Record Configuration Items with AWS Config for Third-Party Resources using the AWS CLI

Record a configuration item for a third-party resource or a custom resource type using the following procedure:

Ensure you register the resource type `MyCustomNamespace::Testing::WordPress` with its matching schema.

1. Open a command prompt or a terminal window.
2. Enter the following command:

```
aws configservice put-resource-config --resource-type
 MyCustomNamespace::Testing::WordPress --resource-id resource-001 --schema-version-
id 00000001 --configuration  '{
  "Id": "resource-001",
  "Name": "My example custom resource.",
  "PublicAccess": false
}'
```

> **Note**
>
> As defined in the type schema, `writeOnlyProperties` will be removed from the configuration prior to being recorded by AWS Config. This means that these values will not be present when the configuration is obtained from read APIs. For more information on `writeOnlyProperties`, see Resource type schema.

Read Configuration Items with AWS Config for Third-Party Resources using the AWS CLI

Read a configuration item for a third-party resource or a custom resource type using the following procedure:

1. Open a command prompt or a terminal window.
2. Enter the following command:

```
aws configservice list-discovered-resources --resource-type
 MyCustomNamespace::Testing::WordPress
```

3. Press Enter.

   You should see output similar to the following:

```
{
    "resourceIdentifiers": [
        {
            "resourceType": "MyCustomNamespace::Testing::WordPress",
            "resourceId": "resource-001"
        }
    ]
}
```

4. Enter the following command:

```
aws configservice batch-get-resource-config --resource-keys '[ { "resourceType":
 "MyCustomNamespace::Testing::WordPress", "resourceId": "resource-001" } ]'
```

5. Press Enter.

You should see output similar to the following:

```
{
    "unprocessedResourceKeys": [],
    "baseConfigurationItems": [
        {
            "configurationItemCaptureTime": 1569605832.673,
            "resourceType": "MyCustomNamespace::Testing::WordPress",
            "resourceId": "resource-001",
            "configurationStateId": "1569605832673",
            "awsRegion": "us-west-2",
            "version": "1.3",
            "supplementaryConfiguration": {},
            "configuration": "{\"Id\":\"resource-001\",\"Name\":\"My example custom
 resource.\",\"PublicAccess\":false}",
            "configurationItemStatus": "ResourceDiscovered",
            "accountId": "AccountId"
        }
    ]
}
```

Delete Third-Party Resources from AWS Config using the AWS CLI

Enter the following command to delete a third-party resource:

```
aws configservice delete-resource-config --resource-type
 MyCustomNamespace::Testing::WordPress --resource-id resource-002
```

If successful, the command executes with no additional output.

Recording Software Configuration for Managed Instances with AWS Config

You can use AWS Config to record software inventory changes on Amazon EC2 instances and on-premises servers. This enables you to see the historical changes to software configuration. For example, when a new Windows update is installed on a managed Windows instance, AWS Config records the changes and then sends the changes to your delivery channel, so that you are notified

about the change. With AWS Config, you can see the history of when Windows updates were installed for the managed instance and how they changed over time.

Topics

- Prerequisites
- Recording Software Configurations

Prerequisites

You must complete the following steps to record software configuration changes:

- Turn on recording for the managed instance inventory resource type in AWS Config.
- Configure EC2 and on-premises servers as *managed instances* in AWS Systems Manager. A managed instance is a machine that has been configured for use with Systems Manager.
- Initiate collection of software inventory from your managed instances using the Systems Manager Inventory capability.

> **Note**
>
> **Systems Manager now supports creating configuration items for *unmanaged instances***
> Configuration item for unmanaged instances will have supplementary configuration with `Key: “InstanceStatus”` and `Value: “Unmanaged”`.
> **Configuration items for unmanaged instances won’t receive additional updates**
> To receive additional updates, the configuration item must be a managed instance.

You can also use AWS Config rules to monitor software configuration changes and be notified whether the changes are compliant or noncompliant against your rules. For example, if you create a rule that checks whether your managed instances have a specified application, and an instance doesn't have that application installed, AWS Config flags that instance as noncompliant against your rule. For a list of AWS Config managed rules, see List of AWS Config Managed Rules.

Recording Software Configurations

To enable recording of software configuration changes in AWS Config:

1. Turn on recording for all supported resource types or selectively record the managed instance inventory resource type in AWS Config. For more information, see Recording AWS Resources with AWS Config.
2. Launch an Amazon EC2 instance with an instance profile for Systems Manager that includes the **AmazonSSMManagedInstanceCore** managed policy. This AWS managed policy enables an instance to use Systems Manager service core functionality.

   For information about other policies you can add to the instance profile for Systems Manager, see Create an IAM Instance Profile for Systems Manager in the *AWS Systems Manager User Guide*.

   > **Important**
   >
   > SSM Agent is Amazon software that must be installed on a managed instance in order to communicate with the Systems Manager in the cloud. If your EC2 instance was created from an AMI for one of the following operating systems, the agent is preinstalled:
   >
   > - Windows Server 2003-2012 R2 AMIs published in November 2016 or later
   > - Windows Server 2016 and 2019
   > - Amazon Linux
   > - Amazon Linux 2
   > - Ubuntu Server 16.04
   > - Ubuntu Server 18.04
   >
   > On EC2 instances that were not created from an AMI with the agent preinstalled, you must install the agent manually. For information, see the following topics in the *AWS Systems Manager User Guide*:
   >
   > - Installing and configuring SSM Agent on EC2 instances for Windows Server
   > - Installing and configuring SSM Agent on EC2 instances for Linux

3. Initiate inventory collection as described in Configuring Inventory Collection in the *AWS Systems Manager User Guide*. The procedures are the same for Linux and Windows instances.

   AWS Config can record configuration changes for the following inventory types:

   - **Applications** – A list of applications for managed instances, such as antivirus software.
   - **AWS components** – A list of AWS components for managed instances, such as the AWS CLI and SDKs.
   - **Instance information** – Instance information such as OS name and version, domain, and firewall status.
   - **Network configuration** – Configuration information such as IP address, gateway, and subnet mask.
   - **Windows Updates** – A list of Windows updates for managed instances (Windows instances only).

   > **Note**
   >
   > AWS Config doesn't support recording the custom inventory type at this time.

Inventory collection is one of many Systems Manager capabilities, which are grouped in the categories *Operations Management*, *Actions & Change*, *Instances & Nodes*, and *Shared Resources*. For more information, see What is Systems Manager? and Systems Manager Capabilities in the *AWS Systems Manager User Guide*.

Looking Up Resources That Are Discovered by AWS Config

You can use the AWS Config console, AWS CLI, and AWS Config API to look up the resources that AWS Config has taken an inventory of, or *discovered*, including deleted resources and resources that AWS Config is not currently recording. AWS Config discovers supported resource types only. For more information, see Supported Resource Types for AWS Config.

Looking Up Resources (Console)

You can use resource types or tag information to look up resources in the AWS Config console.

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. On the **Resource inventory** page, specify the search options for the resources that you want to look up:
   - **Resource category** – Choose all resource categories or narrow results to only AWS Resources.
   - **Resource type** – Choose all resource types or select which resource(s) to filter by.
   - **Compliance** – Choose to filter by any compliance status, compliant, or noncompliant.
3. AWS Config lists the resources that match your search options. You can see the following information about the resources:
   - **Resource identifier** – The resource identifier might be a resource ID or a resource name, if applicable. Choose the resource identifier link to view the resource details page.
   - **Resource type** – The type of the resource is listed.
   - **Compliance** – The status of the resource that AWS Config evaluated against your rule.

Looking Up Resources (AWS CLI)

You can use the AWS CLI to list resources that AWS Config has discovered.

Use the **AWS Configservice** `list-discovered-resources` command:

```
$ aws configservice list-discovered-resources --resource-type "AWS::EC2::Instance"
        {
            "resourceIdentifiers": [
                {
                    "resourceType": "AWS::EC2::Instance",
                    "resourceId": "i-nnnnnnnn"
                }
            ]
        }
```

To view the configuration details of a resource that is listed in the response, use the `get-resource-config-history` command, and specify the resource type and ID. For an example of this command and the response from AWS Config, see Viewing Configuration History.

Looking up Resources (API)

You specify a resource type, and AWS Config returns a list of resource identifiers for resources of that type. For more information, see ResourceIdentifier in the *AWS Config API Reference*.

Use the ListDiscoveredResources action.

To get the configuration details of a resource that is listed in the response, use the GetResourceConfigHistory action, and specify the resource type and ID.

Viewing Compliance Information and Evaluation Results for your AWS Resources with AWS Config

> **Important**
>
> For accurate reporting on the compliance status, you must record the `AWS::Config::ResourceCompliance` resource type. For more information, see Recording AWS Resources.

You can use the AWS Config console or AWS SDKs to view the compliance information and the evaluation results of your resources.

Topics

- Viewing compliance (Console)
- Viewing compliance (AWS SDKs)

Viewing compliance (Console)

To view compliance (Console)

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. In the AWS Management Console menu, verify that the region selector is set to a region that supports AWS Config rules. For the list of supported regions, see AWS Config Regions and Endpoints in the *Amazon Web Services General Reference*.

3. In the navigation pane, choose **Resources**. On the Resource inventory page, you can filter by resource category, resource type, and compliance status. Choose **Include deleted resources** if appropriate. The table displays the resource identifier for the resource type and the resource compliance status for that resource. The resource identifier might be a resource ID or a resource name.
4. Choose a resource from the resource identifier column.
5. Choose the **Resource Timeline** button. You can filter by Configuration events, Compliance events, or CloudTrail Events.

> **Note**
>
> Alternatively, on the Resource inventory page, you can directly choose the resource name. To access the resource timeline from the resource details page, choose the **Resource Timeline** button.

You can also view the compliance of your resources by looking them up on the **Resource inventory** page. For more information, see Looking Up Resources That Are Discovered by AWS Config.

Viewing compliance (AWS SDKs)

To get compliance information for your AWS resources

The following code examples show how to use `DescribeComplianceByResource`.

CLI

AWS CLI

To get compliance information for your AWS resources

The following `describe-compliance-by-resource` example returns compliance information for each EC2 instance that is recorded by AWS Config and that violates one or more rules.

```
aws configservice describe-compliance-by-resource \
    --resource-type AWS::EC2::Instance \
    --compliance-types NON_COMPLIANT
```

In the output, the value for each `CappedCount` attribute indicates how many rules the resource violates. For example, the following output indicates that instance `i-1a2b3c4d` violates 2 rules.

Output:

```
{
    "ComplianceByResources": [
        {
            "ResourceType": "AWS::EC2::Instance",
            "ResourceId": "i-1a2b3c4d",
            "Compliance": {
                "ComplianceContributorCount": {
                    "CappedCount": 2,
                    "CapExceeded": false
                },
                "ComplianceType": "NON_COMPLIANT"
            }
        },
        {
            "ResourceType": "AWS::EC2::Instance",
            "ResourceId": "i-2a2b3c4d ",
            "Compliance": {
                "ComplianceContributorCount": {
                    "CappedCount": 3,
                    "CapExceeded": false
                },
                "ComplianceType": "NON_COMPLIANT"
            }
        }
    ]
}
```

For more information, see Viewing Compliance Information and Evaluation Results for your AWS Resources with AWS Config in the *AWS Config Developer Guide*.

- For API details, see DescribeComplianceByResource in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example checks the `AWS::SSM::ManagedInstanceInventory` resource type for 'COMPLIANT' compliance type.

```
Get-CFGComplianceByResource -ComplianceType COMPLIANT -ResourceType
 AWS::SSM::ManagedInstanceInventory
```

Output:

```
Compliance                              ResourceId          ResourceType
----------                              ----------          ------------
Amazon.ConfigService.Model.Compliance i-0123bcf4b567890e3
 AWS::SSM::ManagedInstanceInventory
Amazon.ConfigService.Model.Compliance i-0a1234f6f5d6b78f7
 AWS::SSM::ManagedInstanceInventory
```

- For API details, see DescribeComplianceByResource in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example checks the `AWS::SSM::ManagedInstanceInventory` resource type for 'COMPLIANT' compliance type.

```
Get-CFGComplianceByResource -ComplianceType COMPLIANT -ResourceType
 AWS::SSM::ManagedInstanceInventory
```

Output:

```
Compliance                              ResourceId          ResourceType
----------                              ----------          ------------
Amazon.ConfigService.Model.Compliance i-0123bcf4b567890e3
 AWS::SSM::ManagedInstanceInventory
Amazon.ConfigService.Model.Compliance i-0a1234f6f5d6b78f7
 AWS::SSM::ManagedInstanceInventory
```

- For API details, see DescribeComplianceByResource in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

To get the compliance summary of your AWS resources

The following code examples show how to use `GetComplianceSummaryByResourceType`.

CLI

AWS CLI

Example 1: To get the compliance summary for all resource types

The following `get-compliance-summary-by-resource-type` example returns the number of AWS resources that are noncompliant and the number that are compliant.

```
aws configservice get-compliance-summary-by-resource-type
```

In the output, the value for each `CappedCount` attribute indicates how many resources are compliant or noncompliant.

Output:

```
{
    "ComplianceSummariesByResourceType": [
        {
            "ComplianceSummary": {
                "NonCompliantResourceCount": {
                    "CappedCount": 16,
                    "CapExceeded": false
                },
                "ComplianceSummaryTimestamp": 1453237464.543,
                "CompliantResourceCount": {
                    "CappedCount": 10,
                    "CapExceeded": false
                }
            }
        }
    ]
}
```

For more information, see Viewing Compliance Information and Evaluation Results for your AWS Resources with AWS Config in the *AWS Config Developer Guide*.

Example 2: To get the compliance summary for a specific resource type

The following `get-compliance-summary-by-resource-type` example returns the number of EC2 instances that are noncompliant and the number that are compliant.

```
aws configservice get-compliance-summary-by-resource-type \
    --resource-types AWS::EC2::Instance
```

In the output, the value for each `CappedCount` attribute indicates how many resources are compliant or noncompliant.

Output:

```
{
    "ComplianceSummariesByResourceType": [
        {
            "ResourceType": "AWS::EC2::Instance",
            "ComplianceSummary": {
                "NonCompliantResourceCount": {
                    "CappedCount": 3,
                    "CapExceeded": false
                },
                "ComplianceSummaryTimestamp": 1452204923.518,
                "CompliantResourceCount": {
                    "CappedCount": 7,
                    "CapExceeded": false
                }
            }
        }
    ]
}
```

For more information, see Viewing Compliance Information and Evaluation Results for your AWS Resources with AWS Config in the *AWS Config Developer Guide*.

- For API details, see GetComplianceSummaryByResourceType in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This sample returns the number of resources that are compliant or noncompliant and converts the output to json.

```
Get-CFGComplianceSummaryByResourceType -Select
 ComplianceSummariesByResourceType.ComplianceSummary | ConvertTo-Json
{
  "ComplianceSummaryTimestamp": "2019-12-14T06:14:49.778Z",
  "CompliantResourceCount": {
    "CapExceeded": false,
    "CappedCount": 2
  },
  "NonCompliantResourceCount": {
    "CapExceeded": true,
    "CappedCount": 100
  }
}
```

- For API details, see GetComplianceSummaryByResourceType in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This sample returns the number of resources that are compliant or noncompliant and converts the output to json.

```
Get-CFGComplianceSummaryByResourceType -Select
 ComplianceSummariesByResourceType.ComplianceSummary | ConvertTo-Json
{
  "ComplianceSummaryTimestamp": "2019-12-14T06:14:49.778Z",
  "CompliantResourceCount": {
    "CapExceeded": false,
    "CappedCount": 2
  },
  "NonCompliantResourceCount": {
    "CapExceeded": true,
    "CappedCount": 100
  }
}
```

- For API details, see GetComplianceSummaryByResourceType in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

To get the evaluation results for an AWS resource

The following code examples show how to use `GetComplianceDetailsByResource`.

CLI

AWS CLI

To get the evaluation results for an AWS resource

The following `get-compliance-details-by-resource` example returns the evaluation results for each rule with which the EC2 instance `i-1a2b3c4d` does not comply.

```
aws configservice get-compliance-details-by-resource \
    --resource-type AWS::EC2::Instance \
    --resource-id i-1a2b3c4d \
    --compliance-types NON_COMPLIANT
```

Output:

```
{
    "EvaluationResults": [
        {
            "EvaluationResultIdentifier": {
                "OrderingTimestamp": 1450314635.065,
                "EvaluationResultQualifier": {
                    "ResourceType": "AWS::EC2::Instance",
                    "ResourceId": "i-1a2b3c4d",
                    "ConfigRuleName": "InstanceTypesAreT2micro"
                }
            },
            "ResultRecordedTime": 1450314643.288,
            "ConfigRuleInvokedTime": 1450314643.034,
            "ComplianceType": "NON_COMPLIANT"
        },
        {
            "EvaluationResultIdentifier": {
                "OrderingTimestamp": 1450314635.065,
                "EvaluationResultQualifier": {
                    "ResourceType": "AWS::EC2::Instance",
                    "ResourceId": "i-1a2b3c4d",
                    "ConfigRuleName": "RequiredTagForEC2Instances"
                }
            },
            "ResultRecordedTime": 1450314645.261,
            "ConfigRuleInvokedTime": 1450314642.948,
            "ComplianceType": "NON_COMPLIANT"
```

```
        }
    ]
}
```

For more information, see Viewing Compliance Information and Evaluation Results for your AWS Resources with AWS Config in the *AWS Config Developer Guide*.

- For API details, see GetComplianceDetailsByResource in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example evaulation results for the given resource.

```
Get-CFGComplianceDetailsByResource -ResourceId ABCD5STJ4EFGHIVEW6JAH -
ResourceType 'AWS::IAM::User'
```

Output:

```
Annotation                 :
ComplianceType             : COMPLIANT
ConfigRuleInvokedTime      : 8/25/2019 11:34:56 PM
EvaluationResultIdentifier :
 Amazon.ConfigService.Model.EvaluationResultIdentifier
ResultRecordedTime         : 8/25/2019 11:34:56 PM
ResultToken                :
```

- For API details, see GetComplianceDetailsByResource in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

ResultRecordedTime          : 8/25/2019 11:34:56 PM
ResultToken                 :
```

- For API details, see GetComplianceDetailsByResource in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Viewing Compliance History for your AWS Resources with AWS Config

> **Important**
>
> The `AWS::Config::ResourceCompliance` resource type is used to store historical compliance results for resources. Recording this resource type is **not required** for Config rules to evaluate resources or for viewing current compliance status in the console. Recording `AWS::Config::ResourceCompliance` only enables you to view historical compliance changes over time in the resource timeline. If you don't need historical compliance data, you can exclude this resource type. For more information about selecting resources to record, see Recording AWS Resources.

You can view the configuration, relationships, and number of changes made to a resource in the AWS Config console. You can view the configuration history for a resource using AWS CLI.

Topics

- Viewing Compliance History (Console)
- Viewing Compliance History (AWS CLI)
- Viewing Compliance History Timeline for Resources and Rules

Viewing Compliance History (Console)

Viewing Compliance History Using the Console

When you look up resources on the **Resource inventory** page, choose the resource name or ID in the resource identifier column to view the resource's details page. The details page provides information about the configuration, relationships, and number of changes made to that resource.

To access the resource timeline from the resource details page, choose the **Resource Timeline** button. The Resource timeline captures changes as `ConfigurationItems` over a period of time for a specific resource. You can filter by Configuration events, Compliance events, or CloudTrail Events.

Viewing Compliance History (AWS CLI)

Viewing Compliance History Using the AWS CLI

The configuration items that AWS Config records are delivered to the specified delivery channel on demand as a configuration snapshot and as a configuration stream. You can use the AWS CLI to view history of configuration items for each resource.

Viewing Configuration History

Enter the `get-resource-config-history` command and specify the resource type and the resource ID, for example:

```
$ aws configservice get-resource-config-history --resource-type AWS::EC2::SecurityGroup
 --resource-id sg-6fbb3807
{
    "configurationItems": [
        {
            "configurationItemCaptureTime": 1414708529.9219999,
            "relationships": [
                {
                    "resourceType": "AWS::EC2::Instance",
                    "resourceId": "i-7a3b232a",
                    "relationshipName": "Is associated with Instance"
                },
                {
                    "resourceType": "AWS::EC2::Instance",
                    "resourceId": "i-8b6eb2ab",
                    "relationshipName": "Is associated with Instance"
```

```
                },
                {
                    "resourceType": "AWS::EC2::Instance",
                    "resourceId": "i-c478efe5",
                    "relationshipName": "Is associated with Instance"
                },
                {
                    "resourceType": "AWS::EC2::Instance",
                    "resourceId": "i-e4cbe38d",
                    "relationshipName": "Is associated with Instance"
                }
            ],

For detailed explanation of the response fields, see Components of a Configuration Item and Supported Resource Types for AWS Config.

Example Amazon EBS Configuration History from AWS Config

AWS Config generates a set of files that each represent a resource type and lists all configuration changes for the resources of that type that AWS Config is recording. AWS Config exports this resource-centric configuration history as an object in the Amazon S3 bucket that you specified when you enabled AWS Config. The configuration history file for each resource type contains the changes that were detected for the resources of that type since the last history file was delivered. The history files are typically delivered every six hours.

The following is an example of the contents of the Amazon S3 object that describes the configuration history of all the Amazon Elastic Block Store volumes in the current region for your AWS account. The volumes in this account include `vol-ce676ccc` and `vol-cia007c`. Volume `vol-ce676ccc` had two configuration changes since the previous history file was delivered while volume `vol-cia007c` had one change.

```

Viewing Compliance History Timeline for Resources and Rules

AWS Config supports storing compliance state changes of resources as evaluated by AWS Config Rules. The resource compliance history is presented in the form of a timeline. The timeline captures changes as `ConfigurationItems` over a period of time for a specific resource. For information on the contents of `ConfigurationItem`, see ConfigurationItem in the AWS Config API Reference.

You can opt in or out to record all resource types in AWS Config. If you have opted to record all resource types, AWS Config automatically begins recording the resource compliance history as evaluated by AWS Config Rules. By default, AWS Config records the configuration changes for all supported resources. You can also select only the specific resource compliance history resource type: `AWS::Config::ResourceCompliance`. For more information, see Recording AWS Records.

Viewing Resource Timeline Using Resources

Access the resource timeline by selecting a specific resource from the Resource inventory page.

1. Choose the **Resources** from the left navigation.
2. On the Resource inventory page, you can filter by resource category, resource type, and compliance status. Choose **Include deleted resources** if appropriate.

   The table displays the resource identifier for the resource type and the resource compliance status for that resource. The resource identifier might be a resource ID or a resource name.
3. Choose a resource from the resource identifier column.
4. Choose the **Resource Timeline** button. You can filter by Configuration events, Compliance events, or CloudTrail Events.

> **Note**
>
> Alternatively, on the Resource inventory page, you can directly choose the resource name. To access the resource timeline from the resource details page, choose the **Resource Timeline** button.

Viewing Resource Timeline Using Rules

Access the resource timeline by selecting a specific rule from the Rule page.

1. Select the **Rules** from the left navigation.
2. On the Rule page, choose a rule evaluating your relevant resources. If no rules are displayed on the screen, add rules using the **Add rule** button.
3. On the Rule details page, select the resources from the Resources evaluated table.
4. Select the **Resource Timeline** button. The resource timeline is displayed.

Querying Compliance History for your AWS Resources

Query the resource compliance history using get-resource-config-history using the resource type `AWS::Config::ResourceCompliance`.

```
aws configservice get-resource-config-history --resource-type
 AWS::Config::ResourceCompliance --resource-id AWS::S3::Bucket/configrules-bucket
```

You should see output similar to the following:

```
{
 "configurationItems": [
  {
   "configurationItemCaptureTime": 1539799966.921,
   "relationships": [
    {
     "resourceType": "AWS::S3::Bucket",
     "resourceId": "configrules-bucket",
     "relationshipName": "Is associated with "
    }
```

```
    ]
    "tags": {},
    "resourceType": "AWS::Config::ResourceCompliance",
    "resourceId": "AWS::S3::Bucket/configrules-bucket",
    "ConfigurationStateId": "1539799966921",
    "relatedEvents": [];
    "awsRegion": "us-west-2",
    "version": "1.3",
    "configurationItemMD5Hash": "",
    "supplementaryConfiguration": {},
    "configuration": "{\"complianceType\":\"COMPLIANT\",\"targetResourceId\":
\"configrules-bucket\",\"targetResourceType\":\"AWS::S3::Bucket\",\configRuleList"\":
[{\"configRuleArn\":\"arn:aws:config:us-west-2:AccountID:config-rule/config-rule-w1gogw
\",\"configRuleId\":\"config-rule-w1gogw\",\"configRuleName\":\"s3-bucket-logging-
enabled\",\"complianceType\":\"COMPLIANT\"}]}",

    "configurationItemStatus": "ResourceDiscovered",
    "accountId": "AccountID"
   }
  ]
}
```

Tagging Your AWS Config Resources

A tag is a label that you assign to an AWS resource. Each tag consists of a *key* and an optional *value*, both of which you define. Tags make it easier to manage, search for, and filter resources.

Tags enable you to categorize your AWS resources in different ways, for example, by purpose, owner, or environment. This is useful when you have many resources of the same type—you can quickly identify a specific resource based on the tags you've assigned to it. You can assign one or more tags to your AWS resources. Each tag has an associated value.

We recommend that you devise a set of tag keys that meets your needs for each resource type. Using a consistent set of tag keys makes it easier for you to manage your AWS resources. You can search and filter the resources based on the tags you add.

Tags are interpreted strictly as a string of characters and are not automatically assigned to your resources. You can edit tag keys and values, and you can remove tags from a resource at any time. You can set the value of a tag to an empty string, but you can't set the value of a tag to null. If you add a tag that has the same key as an existing tag on that resource, the new value overwrites the old value. If you delete a resource, any tags for the resource are also deleted.

You can work with tags using the AWS Command Line Interface (AWS CLI) and the AWS Config API reference.

Restrictions Related to Tagging

The following basic restrictions apply to tags.

Restriction	Description
Maximum number of tags per resource	50
Maximum key length	128 Unicode characters in UTF-8
Maximum value length	256 Unicode characters in UTF-8
Prefix restriction	Do not use the `aws:` prefix in your tag names or values because it is reserved for AWS use. You can't edit or delete tag names or values with this prefix. Tags with this prefix do not count against your tags per resource limit.
Character restrictions	Tags may only contain Unicode letters, digits, whitespace, or these symbols: `_ . : / = + - @`

Managing Tags with AWS Config API Actions

Tag based access controls are available for three resources `ConfigurationAggregator`, `AggregationAuthorization`, and `ConfigRule`. Use the following to add, update, list, and delete the tags for your resources.

- ListTagsForResource
- TagResource
- UntagResource

> **Note**
>
> `TagResource` and `UntagResource` require certain AWS Identity and Access Management (IAM) permissions to control access. For more information, see Controlling access based on tag keys in the IAM User Guide.

Evaluating Resources with AWS Config Rules

Use AWS Config to evaluate the configuration settings of your AWS resources. You do this by creating AWS Config rules, which represent your ideal configuration settings. AWS Config provides customizable, predefined rules called managed rules to help you get started.

Considerations

Cost Considerations

For details about the costs associated with resource recording, see AWS Config pricing.

Recommendation: Consider excluding the `AWS::Config::ResourceCompliance` resource type from recording before deleting rules

Deleting rules creates configuration items (CIs) for `AWS::Config::ResourceCompliance` that can affect your costs for the configuration recorder. If you are deleting rules which evaluate a large number of resource types, this can lead to a spike in the number of CIs recorded.

To avoid the associated costs, you can opt to disable recording for the `AWS::Config::ResourceCompliance` resource type before deleting rules, and re-enable recording after the rules have been deleted.

However, since deleting rules is an asynchronous process, it might take an hour or more to complete. During the time when recording is disabled for `AWS::Config::ResourceCompliance`, rule evaluations will not be recorded in the associated resource's history.

AWS Config recommends that you weigh these factors on a case-by-case basis before deciding how to proceed with deleting rules.

Recommendation: Add logic to handle the evaluation of deleted resources for custom lambda rules

When creating AWS Config custom lambda rules, it is highly recommended that you add logic to handle the evaluation of deleted resources.

When evaluation results are marked as `NOT_APPLICABLE`, they will be marked for deletion and cleaned up. If they're NOT marked as `NOT_APPLICABLE`, the evaluation results will remain unchanged until the rule is deleted, which can cause an unexpected spike in the creation of CIs for `AWS::Config::ResourceCompliance` upon rule deletion.

For information on how to set AWS Config custom lambda rules to return `NOT_APPLICABLE` for deleted resources, see Managing deleted resources with AWS Config custom lambda rules.

Recommendation: Provide the resources in scope for custom lambda rules

AWS Config Custom Lambda Rules can cause a high number of Lambda function invocations if the rule is not scoped to one or more resource types. To avoid increased activity associated with your account, it is highly recommended to provide resources in scope for your Custom Lambda rules. If no resource types are selected, the rule will invoke the Lambda function for all resources in the account.

Other considerations

Defaut Values for Managed Rules

The default values specified for managed rules are pre-populated only when using the AWS console. Default values are not supplied for the API, CLI, or SDK.

Configuration Item Recording Delays

AWS Config usually records configuration changes to your resources right after a change is detected, or at the frequency that you specify. However, this is on a best effort basis and can take longer at times. For example, a resource type with known delays is `AWS::SecretsManager::Secret`. This resource type is an example, and this list is non-exhaustive.

Policies and compliance results

IAM policies and other policies managed in AWS Organizations can impact whether AWS Config has permissions to record configuration changes for your resources. Additionally, rules directly evaluate the configuration of a resource and rules don't take into account these policies when running evaluations. Make sure that the policies in effect align with how you intend to use AWS Config.

Tagging support for resource types

If a resource type does not support tagging or does not include tag information in its describe API response, AWS Config won't capture tag data in the configuration items (CIs) for that resource type. AWS Config will still record these resources. However, any functionality that relies on tag data won't work. This affects tag-based filtering, grouping, or compliance evaluation that relies on tag data.

Directory Buckets Are Not Supported

Managed rules only support general purpose buckets when evaluating Amazon Simple Storage Service (Amazon S3) resources. For more information on general purpose buckets and directory buckets, see Buckets overview and Directory buckets in the Amazon S3 User Guide.

Managed Rules and Global IAM Resource Types

The global IAM resource types onboarded before February 2022 (`AWS::IAM::Group`, `AWS::IAM::Policy`, `AWS::IAM::Role`, and `AWS::IAM::User`) can only be recorded by AWS Config in AWS Regions where AWS Config was available before February 2022. These resource types cannot be recorded in Regions supported by AWS Config after February 2022. For a list of those Regions, see Recording AWS Resources | Global Resources.

If you record a global IAM resource type in at least one Region, periodic rules that report compliance on the global IAM resource type will run evaluations in all Regions where the periodic rule is added, even if you have not enabled the recording of the global IAM resource type in the Region where the periodic rule was added.

To avoid unnecessary evaluations, you should only deploy periodic rules that report compliance on a global IAM resource type to one of the supported Regions. For a list of which managed rules are supported in which Regions, see List of AWS Config Managed Rules by Region Availability.

Region Support

Currently, the AWS Config Rule feature is supported in the following AWS regions. For a list of which individual AWS Config rules are supported in which Regions, see List of AWS Config Managed Rules by Region Availability.

Region Name	Region	Endpoint	Protocol
US East (Ohio)	us-east-2	config.us-east-2.amazonaws.com config-fips.us-east-2.amazonaws.com	HTTPS HTTPS
US East (N. Virginia)	us-east-1	config.us-east-1.amazonaws.com config-fips.us-east-1.amazonaws.com	HTTPS HTTPS

Components of an AWS Config Rule

AWS Config rules evaluate the configuration settings of your AWS resources. This page discusses the components of a rule.

Topics

- How AWS Config Rules Work
- Trigger Types
- Evaluation Modes
- AWS Config Rule Metadata

How AWS Config Rules Work

While AWS Config continuously tracks the configuration changes that occur among your resources, it checks whether these changes do not comply with the conditions in your rules. If a resource does not comply with rule, AWS Config flags the resource and the rule as *noncompliant*.

There are four possible evaluation results for an AWS Config rule.

Evaluation result	Description
`COMPLIANT`	The rule passes the conditions of the compliance check.
`NON_COMPLIANT`	The rule fails the conditions of the compliance check.
`ERROR`	The one of the required/optional parameter s is not valid, not of the correct type, or is formatted incorrectly.
`NOT_APPLICABLE`	Used to filter out resources that the logic of the rule cannot be applied to. For example, the alb-desync-mode-check rule only checks Application Load Balancers, and ignores Network Load Balancers and Gateway Load Balancers.

For example, when an EC2 volume is created, AWS Config can evaluate the volume against a rule that requires volumes to be encrypted. If the volume is not encrypted, AWS Config flags the volume and the rule as noncompliant. AWS Config can also check all of your resources for account-wide requirements. For example, AWS Config can check whether the number of EC2 volumes in an account stays within a desired total, or whether an account uses AWS CloudTrail for logging.

Trigger Types

After you add a rule to your account, AWS Config compares your resources to the conditions of the rule. After this initial evaluation, AWS Config continues to run evaluations each time one is triggered. The evaluation triggers are defined as part of the rule, and they can include the following types.

Trigger type	Description
Configuration changes	AWS Config runs evaluations for the rule when there is a resource that matches the rule's scope and there is a change in configuration of the resource. The evaluation runs after AWS Config sends a configuration item change notification. You choose which resources initiate the evaluation by defining the rule's *scope*. The scope can include the following: • One or more resource types • A combination of a resource type and a resource ID • A combination of a tag key and value • When any recorded resource is created, updated, or deleted AWS Config runs the evaluation when it detects a change to a resource that matches the rule's scope. You can use the scope to define which resources initiate evaluations.

Trigger type	Description
Periodic	AWS Config runs evaluations for the rule at a frequency that you choose; for example, every 24 hours.
Hybrid	Some rules have both configuration change and periodic triggers. For these rules, AWS Config evaluates your resources when it detects a configuration change and also at the frequency that you specify.

Evaluation Modes

There are two evaluation modes for AWS Config rules.

Evaluation mode	Description
Proactive	Use proactive evaluation to evaluate resources before they have been deployed. This allows you to evaluate whether a set of resource properties, if used to define an AWS resource, would be COMPLIANT or NON_COMPLIANT given the set of proactive rules that you have in your account in your Region.
Detective	Use detective evaluation to evaluate resources that have already been deployed. This allows you to evaluate the configuration settings of your existing resources.

> **Note**
>
> Proactive rules do not remediate resources that are flagged as NON_COMPLIANT or prevent them from being deployed.

For more information, see Turning on Proactive Evaluation for AWS Config Rules.

List of managed rules with proactive evaluation

For a list of managed rules that support proactive evaluation, see List of AWS Config Managed Rules by Evaluation Mode.

List of supported resource types for proactive evaluation

The following is a list of resource types that are supported for proactive evaluation:

- `AWS::EC2::Subnet`

AWS Config Rule Metadata

AWS Config rules can contain the following mutable metadata:

defaultName

The defaultName is the name that instances of a rule will get by default.

description

The rule description provides context for what the rule evaluates. The AWS Config Console has a limit of 256 characters. As a best practice, the rule description should begin with “Checks if” and include a description of the NON_COMPLIANT scenario. Service Names should be written in full beginning with AWS or Amazon when first mentioned in the rule description. For example, AWS CloudTrail or Amazon CloudWatch instead of CloudTrail or CloudWatch for first use. Services names can be abbreviated after subsequent reference.

scope

The scope determines which resource types the rule targets. For a list of supported resource types, see Supported Resource Types.

compulsoryInputParameterDetails

The compulsoryInputParameterDetails are used for parameters that are required for a rule to do its evaluation. For example, the `access-keys-rotated` managed rule includes `maxAccessKeyAge` as a required parameter. If a parameter is required, it will not be marked as (Optional). For each parameter, a type must be specified. Type can be one of "String", "int", "double", "CSV", "boolean" and "StringMap".

optionalInputParameterDetails

The optionalInputParameterDetails are used for parameters that are optional for a rule to do its evaluation. For example, the `elasticsearch-logs-to-cloudwatch` managed rule includes `logTypes` as an optional parameter. For each parameter, a type must be specified. Type can be one of "String", "int", "double", "CSV", "boolean" and "StringMap".

supportedEvaluationModes

The supportedEvaluationModes determines when resources will be evaluated, either before a resource has been deployed or after a resource has been deployed.

`DETECTIVE` is used to evaluate resources which have already been deployed. This allows you to evaluate the configuration settings of your existing resources. `PROACTIVE` is used to evaluate resources before they have been deployed.

This allows you to evaluate whether a set of resource properties, if used to define an AWS resource, would be COMPLIANT or NON_COMPLIANT given the set of proactive rules that you have in your account in your Region.

You can specify the supportedEvaluationModes to `DETECTIVE`, `PROACTIVE`, or both `DETECTIVE` and `PROACTIVE`. You must specify an evaluation mode and this field cannot remain empty.

> **Note**
>
> Proactive rules do not remediate resources that are flagged as NON_COMPLIANT or prevent them from being deployed.

AWS Config Managed Rules

AWS Config provides *AWS managed rules*, which are predefined, customizable rules that AWS Config uses to evaluate whether your AWS resources comply with common best practices. For example, you could use a managed rule to quickly start assessing whether your Amazon Elastic Block Store (Amazon EBS) volumes are encrypted or whether specific tags are applied to your resources.

The AWS Config console guides you through the process of configuring and activating a managed rule. You can also use the AWS Command Line Interface or AWS Config API to pass the JSON code that defines your configuration of a managed rule.

You can customize the behavior of a managed rule to suit your needs. For example, you can define the rule's scope to constrain which resources trigger an evaluation for the rule, such as EC2 instances or volumes.

You can customize the rule's parameters to define attributes that your resources must have to comply with the rule. For example, you can customize a parameter to specify that your security group should block incoming traffic to a specific port number.

Before using managed rules, see Considerations.

List of AWS Config Managed Rules

AWS Config currently supports the following managed rules. Before using these rules, see Considerations.

access-keys-rotated

Checks if active IAM access keys are rotated (changed) within the number of days specified in `maxAccessKeyAge`. The rule is NON_COMPLIANT if access keys are not rotated within the specified time period. The default value is 90 days.

> **Warning**
>
> Do not provide your access keys to unauthorized parties, even to help find your account identifiers. By doing this, you might give someone permanent access to your account. The security best practice is to remove passwords and access keys when users no longer need them.

> **Note**
>
> **Resource Type Marked as Noncompliant in the Console**
>
> If this rule finds that any of your access keys are noncompliant, the `AWS::IAM::User` resource type will also be marked as noncompliant in the AWS console.
>
> **Managed Rules and Global IAM Resource Types**
>
> The global IAM resource types onboarded before February 2022 (`AWS::IAM::Group`, `AWS::IAM::Policy`, `AWS::IAM::Role`, and `AWS::IAM::User`) can only be recorded by AWS Config in AWS Regions where AWS Config was available before February 2022. These resource types cannot be recorded in Regions supported by AWS Config after February 2022. For a list of those Regions, see Recording AWS Resources | Global Resources.
>
> If you record a global IAM resource type in at least one Region, periodic rules that report compliance on the global IAM resource type will run evaluations in all Regions where the periodic rule is added, even if you have not enabled the recording of the global IAM resource type in the Region where the periodic rule was added.
>
> To avoid unnecessary evaluations, you should only deploy periodic rules that report compliance on a global IAM resource type to one of the supported Regions. For a list of which managed rules are supported in which Regions, see List of AWS Config Managed Rules by Region Availability.
>
> **Limitations**
>
> This rule does not apply to AWS account root user access keys. To delete or rotate your root user access keys, use your root user credentials to sign in to the My Security Credentials page in the AWS Management Console at https://aws.amazon.com/console/.

Identifier: ACCESS_KEYS_ROTATED

Resource Types: AWS::IAM::User

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

maxAccessKeyAge, Type: int, Default: 90

Maximum number of days without rotation. Default 90.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

account-part-of-organizations

Rule checks whether AWS account is part of AWS Organizations. The rule is NON_COMPLIANT if the AWS account is not part of AWS Organizations or AWS Organizations management account ID does not match rule parameter `MasterAccountId`.

> **Note**
>
> **Managed Rules and Global IAM Resource Types**
> The global IAM resource types onboarded before February 2022 (`AWS::IAM::Group`, `AWS::IAM::Policy`, `AWS::IAM::Role`, and `AWS::IAM::User`) can only be recorded by AWS Config in AWS Regions where AWS Config was available before February 2022. These resource types cannot be recorded in Regions supported by AWS Config after February 2022. For a list of those Regions, see Recording AWS Resources | Global Resources.
> If you record a global IAM resource type in at least one Region, periodic rules that report compliance on the global IAM resource type will run evaluations in all Regions where the periodic rule is added, even if you have not enabled the recording of the global IAM resource type in the Region where the periodic rule was added.
> To avoid unnecessary evaluations, you should only deploy periodic rules that report compliance on a global IAM resource type to one of the supported Regions. For a list of which managed rules are supported in which Regions, see List of AWS Config Managed Rules by Region Availability.

Identifier: ACCOUNT_PART_OF_ORGANIZATIONS

Trigger type: Periodic

AWS Region: All supported AWS regions except China (Beijing) Region

Parameters:

MasterAccountId (Optional), Type: String

The management account ID for an AWS account.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

acmpca-certificate-authority-tagged

Checks if AWS Private CA certificate authorities have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: ACMPCA_CERTIFICATE_AUTHORITY_TAGGED

Resource Types: AWS::ACMPCA::CertificateAuthority

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

acm-certificate-expiration-check

Checks if AWS Certificate Manager Certificates in your account are marked for expiration within the specified number of days. Certificates provided by ACM are automatically renewed. ACM does not automatically renew certificates that you import. The rule is NON_COMPLIANT if your certificates are about to expire.

Identifier: ACM_CERTIFICATE_EXPIRATION_CHECK

Resource Types: AWS::ACM::Certificate

Trigger type: Configuration changes and Periodic

AWS Region: All supported AWS regions

Parameters:

daysToExpiration (Optional), Type: int, Default: 14

Specify the number of days before the rule flags the ACM Certificate as noncompliant.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

acm-certificate-rsa-check

Checks if RSA certificates managed by AWS Certificate Manager (ACM) have a key length of at least '2048' bits.The rule is NON_COMPLIANT if the minimum key length is less than 2048 bits.

Identifier: ACM_CERTIFICATE_RSA_CHECK

Resource Types: AWS::ACM::Certificate

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

acm-certificate-transparent-logging-enabled

Checks if AWS Certificate Manager certificates have certificate transparency logging enabled. The rule is NON_COMPLIANT if CertificateTransparencyLoggingPreference is explicitly set DISABLED.

Identifier: ACM_CERTIFICATE_TRANSPARENT_LOGGING_ENABLED

Resource Types: AWS::ACM::Certificate

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

acm-pca-root-ca-disabled

Checks if AWS Private Certificate Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.

Identifier: ACM_PCA_ROOT_CA_DISABLED

Resource Types: AWS::ACMPCA::CertificateAuthority

Trigger type: Periodic

AWS Region: All supported AWS regions except China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Canada West (Calgary), China (Ningxia) Region

Parameters:

exemptedCAArns (Optional), Type: CSV

Comma-separated list of Amazon Resource Names (ARN) of CA's that can be enabled. This value can be supplied for other CAs, like specific root CAs or intermediate CA's that can be enabled.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

active-mq-supported-version

Checks if an Amazon MQ ActiveMQ broker is running on a specified minimum supported engine version. The rule is NON_COMPLIANT if the ActiveMQ broker is not running on the minimum supported engine version that you specify.

Identifier: ACTIVE_MQ_SUPPORTED_VERSION

Resource Types: AWS::AmazonMQ::Broker

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

supportedEngineVersion, Type: String

String value for the rule to check the minimum supported engine version for the ActiveMQ broker. ActiveMQ brokers use semantic versioning specification: X.Y.Z. X denotes the major version, Y represents the minor version, and Z denotes the patch version.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

alb-desync-mode-check

Checks if an Application Load Balancer (ALB) is configured with a user defined desync mitigation mode. The rule is NON_COMPLIANT if ALB desync mitigation mode does not match with the user defined desync mitigation mode.

Identifier: ALB_DESYNC_MODE_CHECK

Resource Types: AWS::ElasticLoadBalancingV2::LoadBalancer

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

desyncMode, Type: CSV

> Comma-separated list, in which customers can choose max 2 values among - 'defensive', 'strictest', and 'monitor'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

alb-http-drop-invalid-header-enabled

Checks if rule evaluates AWS Application Load Balancers (ALB) to ensure they are configured to drop http headers. The rule is NON_COMPLIANT if the value of routing.http.drop_invalid_header_fields.enabled is set to false

Identifier: ALB_HTTP_DROP_INVALID_HEADER_ENABLED

Resource Types: AWS::ElasticLoadBalancingV2::LoadBalancer

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

alb-http-to-https-redirection-check

Checks if HTTP to HTTPS redirection is configured on all HTTP listeners of Application Load Balancers. The rule is NON_COMPLIANT if one or more HTTP listeners of Application Load Balancer do not have HTTP to HTTPS redirection configured. The rule is also NON_COMPLIANT if one of more HTTP listeners have forwarding to an HTTP listener instead of redirection.

Identifier: ALB_HTTP_TO_HTTPS_REDIRECTION_CHECK

Resource Types: AWS::ElasticLoadBalancingV2::LoadBalancer

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

alb-internal-scheme-check

Checks if an Application Load Balancer scheme is internal. The rule is NON_COMPLIANT if configuration.scheme is not set to internal.

Identifier: ALB_INTERNAL_SCHEME_CHECK

Resource Types: AWS::ElasticLoadBalancingV2::LoadBalancer

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

alb-listener-tagged

Checks if Application Load Balancer listeners have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: ALB_LISTENER_TAGGED

Resource Types: AWS::ElasticLoadBalancingV2::Listener

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

alb-tagged

Checks if Application Load Balancers have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: ALB_TAGGED

Resource Types: AWS::ElasticLoadBalancingV2::LoadBalancer

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

alb-waf-enabled

Checks if Web Application Firewall (WAF) is enabled on Application Load Balancers (ALBs). This rule is NON_COMPLIANT if key: waf.enabled is set to false.

Identifier: ALB_WAF_ENABLED

Resource Types: AWS::ElasticLoadBalancingV2::LoadBalancer

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

wafWebAclIds (Optional), Type: CSV

Comma separated list of web ACL ID (for WAF) or web ACL ARN (for WAFV2) checking for ALB association

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

amplify-app-branch-auto-deletion-enabled

Checks if AWS Amplify apps automatically disconnect a branch in Amplify Hosting when you delete a branch from your Git repository. The rule is NON_COMPLIANT if configuration.EnableBranchAutoDeletion is false.

Identifier: AMPLIFY_APP_BRANCH_AUTO_DELETION_ENABLED

Resource Types: AWS::Amplify::App

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

amplify-app-build-spec-configured

Checks if AWS Amplify apps have a build specification configured. The rule is NON_COMPLIANT if configuration.BuildSpec does not exist.

Identifier: AMPLIFY_APP_BUILD_SPEC_CONFIGURED

Resource Types: AWS::Amplify::App

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

amplify-app-description

Checks if AWS Amplify apps have a description. The rule is NON_COMPLIANT if configuration.Description does not exist or is an empty string.

Identifier: AMPLIFY_APP_DESCRIPTION

Resource Types: AWS::Amplify::App

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

amplify-app-no-environment-variables

Checks that AWS Amplify apps do not contain environment variables. The rule is NON_COMPLIANT if configuration.EnvironmentVariables is not an empty list.

Identifier: AMPLIFY_APP_NO_ENVIRONMENT_VARIABLES

Resource Types: AWS::Amplify::App

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

amplify-app-platform-check

Checks if AWS Amplify apps are configured with the specified platform. The rule is NON_COMPLIANT if configuration.Platform is a value not specified in the required rule parameter.

Identifier: AMPLIFY_APP_PLATFORM_CHECK

Resource Types: AWS::Amplify::App

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

approvedPlatform, Type: String

The approved platform for the rule to check. The rule is NON_COMPLIANT if configuration.Platform is a value not specified in this parameter. Valid values include: 'WEB', 'WEB_DYNAMIC', and 'WEB_COMPUTE'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

amplify-app-tagged

Checks if AWS Amplify apps have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: AMPLIFY_APP_TAGGED

Resource Types: AWS::Amplify::App

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

amplify-branch-auto-build-enabled

Checks if AWS Amplify branches have auto build enabled. The rule is NON_COMPLIANT if configuration.EnableAutoBuild is false.

Identifier: AMPLIFY_BRANCH_AUTO_BUILD_ENABLED

Resource Types: AWS::Amplify::Branch

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

amplify-branch-build-spec-configured

Checks if AWS Amplify branches have a build specification configured. The rule is NON_COMPLIANT if configuration.BuildSpec does not exist.

Identifier: AMPLIFY_BRANCH_BUILD_SPEC_CONFIGURED

Resource Types: AWS::Amplify::Branch

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

amplify-branch-description

Checks if AWS Amplify branches have a description. The rule is NON_COMPLIANT if configuration.Description does not exist or is an empty string.

Identifier: AMPLIFY_BRANCH_DESCRIPTION

Resource Types: AWS::Amplify::Branch

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

amplify-branch-framework-configured

Checks if AWS Amplify branches have a framework configured. The rule is NON_COMPLIANT if configuration.Framework does not exist.

Identifier: AMPLIFY_BRANCH_FRAMEWORK_CONFIGURED

Resource Types: AWS::Amplify::Branch

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

approvedFrameworks (Optional), Type: CSV

Comma-separated list of approved frameworks for the rule to check. If provided, the rule is NON_COMPLIANT if configuration.Framework is a value not specified in this parameter.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

amplify-branch-performance-mode-enabled

Checks if AWS Amplify branches have performance mode enabled. The rule is NON_COMPLIANT if configuration.EnablePerformanceMode is false.

Identifier: AMPLIFY_BRANCH_PERFORMANCE_MODE_ENABLED

Resource Types: AWS::Amplify::Branch

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

amplify-branch-pull-request-preview-enabled

Checks if AWS Amplify branches have pull request preview enabled. The rule is NON_COMPLIANT if configuration.EnablePullRequestPreview is false.

Identifier: AMPLIFY_BRANCH_PULL_REQUEST_PREVIEW_ENABLED

Resource Types: AWS::Amplify::Branch

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

amplify-branch-tagged

Checks if AWS Amplify branches have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: AMPLIFY_BRANCH_TAGGED

Resource Types: AWS::Amplify::Branch

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

apigatewayv2-integration-private-https-enabled

Checks if Amazon API Gateway V2 private integration traffic for HTTP APIs uses the HTTPS protocol. The rule is NON_COMPLIANT if configuration.TlsConfig does not exist.

Identifier: APIGATEWAYV2_INTEGRATION_PRIVATE_HTTPS_ENABLED

Resource Types: AWS::ApiGatewayV2::Integration

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

apigatewayv2-stage-description

Checks if Amazon API Gateway V2 stages have a description. The rule is NON_COMPLIANT if configuration.Description does not exist or is an empty string.

Identifier: APIGATEWAYV2_STAGE_DESCRIPTION

Resource Types: AWS::ApiGatewayV2::Stage

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

apigateway-domain-name-tls-check

Checks if Amazon API Gateway domain names are configured with TLS 1.2 or higher.
The rule is NON_COMPLIANT if configuration.SecurityPolicy is 'TLS_1_0', or if the '`allowedSecurityPolicies`' parameter is provided and the security policy does not match.

Identifier: APIGATEWAY_DOMAIN_NAME_TLS_CHECK

Resource Types: AWS::ApiGateway::DomainName

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), China (Ningxia) Region

Parameters:

allowedSecurityPolicies (Optional), Type: CSV

> Comma-separated list of allowed security policies for the rule to check. If provided, the rule is NON_COMPLIANT if configuration.SecurityPolicy is configured with a value not specified in this parameter. Valid values include: 'TLS_1_0', 'TLS_1_2', 'SecurityPolicy_TLS13_1_3_2025_09', 'SecurityPolicy_TLS13_1_3_FIPS_2025_09', 'SecurityPolicy_TLS13_1_2_PFS_PQ_2025_09',

'SecurityPolicy_TLS13_1_2_FIPS_PQ_2025_09', 'SecurityPolicy_TLS13_1_2_PQ_2025_09', 'SecurityPolicy_TLS13_1_2_2021_06', 'SecurityPolicy_TLS13_2025_EDGE', 'SecurityPolicy_TLS12_PFS_2025_EDGE', 'SecurityPolicy_TLS12_2018_EDGE', and 'SecurityPolicy_TLS13_1_2_FIPS_PFS_PQ_2025_09'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

apigateway-stage-access-logs-enabled

Checks if Amazon API Gateway stages have access logging enabled. The rule is NON_COMPLIANT if 'accessLogSettings' is not present in Stage configuration.

Identifier: APIGATEWAY_STAGE_ACCESS_LOGS_ENABLED

Resource Types: AWS::ApiGateway::Stage

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

apigateway-stage-description

Checks if Amazon API Gateway stages have a description. The rule is NON_COMPLIANT if configuration.Description does not exist or is an empty string.

Identifier: APIGATEWAY_STAGE_DESCRIPTION

Resource Types: AWS::ApiGateway::Stage

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

api-gwv2-access-logs-enabled

Checks if Amazon API Gateway V2 stages have access logging enabled. The rule is NON_COMPLIANT if 'accessLogSettings' is not present in Stage configuration.

Identifier: API_GWV2_ACCESS_LOGS_ENABLED

Resource Types: AWS::ApiGatewayV2::Stage

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

api-gwv2-authorization-type-configured

Checks if Amazon API Gatewayv2 API routes have an authorization type set. This rule is NON_COMPLIANT if the authorization type is NONE.

Identifier: API_GWV2_AUTHORIZATION_TYPE_CONFIGURED

Resource Types: AWS::ApiGatewayV2::Route

Trigger type: Periodic

AWS Region: All supported AWS regions except Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

authorizationType (Optional), Type: String

Parameter to check API routes' authorization types against. String parameters matching CUSTOM, AWS_IAM, JWT are valid.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

api-gwv2-stage-default-route-detailed-metrics-enabled

Checks if the default route settings for Amazon API Gateway V2 stages have detailed metrics enabled. The rule is NON_COMPLIANT if configuration.defaultRouteSettings.detailedMetricsEnabled is false.

Identifier: API_GWV2_STAGE_DEFAULT_ROUTE_DETAILED_METRICS_ENABLED

Resource Types: AWS::ApiGatewayV2::Stage

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

api-gw-associated-with-waf

Checks if an Amazon API Gateway API stage is using an AWS WAF web access control list (web ACL). The rule is NON_COMPLIANT if an AWS WAF Web ACL is not used or if a used AWS Web ACL does not match what is listed in the rule parameter.

Identifier: API_GW_ASSOCIATED_WITH_WAF

Resource Types: AWS::ApiGateway::Stage

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Taipei) Region

Parameters:

WebAclArns (Optional), Type: CSV

Comma-separated list of web ACL Amazon Resource Names (ARNs)

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

api-gw-cache-enabled-and-encrypted

Checks if all methods in Amazon API Gateway stages have cache enabled and cache encrypted. The rule is NON_COMPLIANT if any method in an Amazon API Gateway stage is not configured to cache or the cache is not encrypted.

Identifier: API_GW_CACHE_ENABLED_AND_ENCRYPTED

Resource Types: AWS::ApiGateway::Stage

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Taipei) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

api-gw-endpoint-type-check

Checks if Amazon API Gateway APIs are of the type specified in the rule parameter `endpointConfigurationType`. The rule returns NON_COMPLIANT if the REST API does not match the endpoint type configured in the rule parameter.

Identifier: API_GW_ENDPOINT_TYPE_CHECK

Resource Types: AWS::ApiGateway::RestApi

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Taipei) Region

Parameters:

endpointConfigurationTypes, Type: CSV

Comma-separated list of allowed endpointConfigurationTypes. Allowed values are REGIONAL, PRIVATE and EDGE.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

api-gw-execution-logging-enabled

Checks if all methods in Amazon API Gateway stages have logging enabled. The rule is NON_COMPLIANT if logging is not enabled, or if `loggingLevel` is neither ERROR nor INFO.

Identifier: API_GW_EXECUTION_LOGGING_ENABLED

Resource Types: AWS::ApiGateway::Stage, AWS::ApiGatewayV2::Stage

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Taipei) Region

Parameters:

loggingLevel (Optional), Type: String, Default: ERROR,INFO

Comma-separated list of specific logging levels (for example, ERROR, INFO or ERROR,INFO).

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

api-gw-rest-api-tagged

Checks if AWS ApiGateway REST API resources resources have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: API_GW_REST_API_TAGGED

Resource Types: AWS::ApiGateway::RestApi

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

api-gw-ssl-enabled

Checks if a REST API stage uses an SSL certificate. The rule is NON_COMPLIANT if the REST API stage does not have an associated SSL certificate.

> **Note**
>
> This rule returns `NOT_APPLICABLE` if the GetIntegration API returns an integration type other than `HTTP` as type. This rule evaluates the SSL certificate configuration in API Gateway stage settings, not the actual deployed state.

Identifier: API_GW_SSL_ENABLED

Resource Types: AWS::ApiGateway::Stage

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Taipei) Region

Parameters:

CertificateIDs (Optional), Type: CSV

Comma-separated list of client certificate IDs configured on a REST API stage.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

api-gw-stage-tagged

Checks if AWS ApiGateway stage resources resources have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: API_GW_STAGE_TAGGED

Resource Types: AWS::ApiGateway::Stage

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

api-gw-xray-enabled

Checks if AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.

Identifier: API_GW_XRAY_ENABLED

Resource Types: AWS::ApiGateway::Stage

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Taipei) Region

Parameters:

None

Proactive Evaluation

For steps on how to run this rule in proactive mode, see Evaluating Your Resources with AWS Config Rules. For this rule to return COMPLIANT in proactive mode, the resource configuration schema for the StartResourceEvaluation API needs to include the following inputs, encoded as a string:

```
"ResourceConfiguration":
...
{
   "TracingEnabled": BOOLEAN,
   "RestApiId": "my-rest-api-Id",
}
...
```

For more information on proactive evaluation, see Evaluation Mode.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appconfig-application-description

Checks if AWS AppConfig applications have a description. The rule is NON_COMPLIANT if configuration.Description does not exist or is an empty string.

Identifier: APPCONFIG_APPLICATION_DESCRIPTION

Resource Types: AWS::AppConfig::Application

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appconfig-application-tagged

Checks if AWS AppConfig applications have tags. Optionally, you can specify tag keys for the rule to check. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: APPCONFIG_APPLICATION_TAGGED

Resource Types: AWS::AppConfig::Application

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), AWS

GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appconfig-configuration-profile-tagged

Checks if AWS AppConfig configuration profiles have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: APPCONFIG_CONFIGURATION_PROFILE_TAGGED

Resource Types: AWS::AppConfig::ConfigurationProfile

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appconfig-configuration-profile-validators-not-empty

Checks if an AWS AppConfig configuration profile includes at least one validator for syntactic or semantic check to ensure the configuration deploy functions as intended. The rule is NON_COMPLIANT if the Validators property is an empty array.

Identifier: APPCONFIG_CONFIGURATION_PROFILE_VALIDATORS_NOT_EMPTY

Resource Types: AWS::AppConfig::ConfigurationProfile

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appconfig-deployment-strategy-description

Checks if AWS AppConfig deployment strategies have a description. The rule is NON_COMPLIANT if configuration.Description does not exist or is an empty string.

Identifier: APPCONFIG_DEPLOYMENT_STRATEGY_DESCRIPTION

Resource Types: AWS::AppConfig::DeploymentStrategy

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appconfig-deployment-strategy-minimum-final-bake-time

Checks if an AWS AppConfig deployment strategy requires the specified minimum bake time. The rule is NON_COMPLIANT if the deployment strategy has a final bake time less than value specified in the rule parameter. The default value is 30 minutes.

Identifier: APPCONFIG_DEPLOYMENT_STRATEGY_MINIMUM_FINAL_BAKE_TIME

Resource Types: AWS::AppConfig::DeploymentStrategy

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

minBakeTime (Optional), Type: int, Default: 30

> The minimum bake time in minutes of the AWS AppConfig deployment strategy for the rule to check. The rule is NON_COMPLIANT if the bake time is less than the value specified in this parameter. Valid values are 0 to 1440. The default value is 30.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appconfig-deployment-strategy-replicate-to-ssm

Checks if AWS AppConfig deployment strategies save the deployment strategy to an AWS Systems Manager (SSM) document. The rule is NON_COMPLIANT if configuration.ReplicateTo is not 'SSM_DOCUMENT'.

Identifier: APPCONFIG_DEPLOYMENT_STRATEGY_REPLICATE_TO_SSM

Resource Types: AWS::AppConfig::DeploymentStrategy

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appconfig-deployment-strategy-tagged

Checks if AWS AppConfig deployment strategies have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: APPCONFIG_DEPLOYMENT_STRATEGY_TAGGED

Resource Types: AWS::AppConfig::DeploymentStrategy

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

includePredefinedSystemResources, Type: boolean, Default: False

A boolean that specifies whether to include predefined deployment strategies for the rule to check. The default value is false.

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appconfig-environment-description

Checks if AWS AppConfig environments have a description. The rule is NON_COMPLIANT if configuration.Description does not exist or is an empty string.

Identifier: APPCONFIG_ENVIRONMENT_DESCRIPTION

Resource Types: AWS::AppConfig::Environment

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appconfig-environment-tagged

Checks if AWS AppConfig environments have tags. Optionally, you can specify tag keys for the rule to check. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: APPCONFIG_ENVIRONMENT_TAGGED

Resource Types: AWS::AppConfig::Environment

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appconfig-extension-association-tagged

Checks if AWS AppConfig extension associations have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: APPCONFIG_EXTENSION_ASSOCIATION_TAGGED

Resource Types: AWS::AppConfig::ExtensionAssociation

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appconfig-freeform-profile-config-storage

Checks if freeform configuration profiles for AWS AppConfig store their configuration data in AWS Secrets Manager or AWS AppConfig hosted configuration store. The rule is NON_COMPLIANT if configuration.LocationUri is not secretsmanager or hosted.

Identifier: APPCONFIG_FREEFORM_PROFILE_CONFIG_STORAGE

Resource Types: AWS::AppConfig::ConfigurationProfile

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appconfig-hosted-configuration-version-description

Checks if AWS AppConfig hosted configuration versions have a description. The rule is NON_COMPLIANT if configuration.Description does not exist or is an empty string.

Identifier: APPCONFIG_HOSTED_CONFIGURATION_VERSION_DESCRIPTION

Resource Types: AWS::AppConfig::HostedConfigurationVersion

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appflow-flow-tagged

Checks if Amazon AppFlow flows have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: APPFLOW_FLOW_TAGGED

Resource Types: AWS::AppFlow::Flow

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Africa (Cape Town), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appflow-flow-trigger-type-check

Checks if an Amazon AppFlow flow runs using the specified trigger type. The rule is NON_COMPLAINT if the flow does not run using the flow type specified in the required rule parameter.

Identifier: APPFLOW_FLOW_TRIGGER_TYPE_CHECK

Resource Types: AWS::AppFlow::Flow

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Africa (Cape Town), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

triggerType, Type: CSV

Comma-separated list of trigger types for the rule to check. Valid values include: 'Scheduled', 'Event', and 'OnDemand'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appintegrations-application-approved-origins-check

Checks that Amazon AppIntegrations applications do not contain approved origins. The rule is NON_COMPLIANT if configuration.ApplicationSourceConfig.ExternalUrlConfig.ApprovedOrigins is not an empty list.

Identifier: APPINTEGRATIONS_APPLICATION_APPROVED_ORIGINS_CHECK

Resource Types: AWS::AppIntegrations::Application

Trigger type: Configuration changes

AWS Region: Only available in Africa (Cape Town), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

allowedApprovedOrigins (Optional), Type: CSV

> Comma-separated list of approved origins that are allowed to access the application. If provided, the rule is NON_COMPLIANT if configuration.ApplicationSourceConfig.ExternalUrlConfig.ApprovedOrigins contains origins not specified in this parameter.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appintegrations-application-tagged

Checks if AWS AppIntegrations application resources have tags. Optionally, required tag keys can be specified. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys aren't present. The rule doesn't check for tags starting with 'aws:'.

Identifier: APPINTEGRATIONS_APPLICATION_TAGGED

Resource Types: AWS::AppIntegrations::Application

Trigger type: Configuration changes

AWS Region: Only available in Africa (Cape Town), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appintegrations-event-integration-description

Checks if Amazon AppIntegrations event integrations have a description. The rule is NON_COMPLIANT if configuration.Description does not exist.

Identifier: APPINTEGRATIONS_EVENT_INTEGRATION_DESCRIPTION

Resource Types: AWS::AppIntegrations::EventIntegration

Trigger type: Configuration changes

AWS Region: Only available in Africa (Cape Town), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appintegrations-event-integration-tagged

Checks if Amazon AppIntegrations event integrations have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: APPINTEGRATIONS_EVENT_INTEGRATION_TAGGED

Resource Types: AWS::AppIntegrations::EventIntegration

Trigger type: Configuration changes

AWS Region: Only available in Africa (Cape Town), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appmesh-gateway-route-tagged

Checks if AWS App Mesh gateway routes have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: APPMESH_GATEWAY_ROUTE_TAGGED

Resource Types: AWS::AppMesh::GatewayRoute

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appmesh-mesh-deny-tcp-forwarding

Checks if proxies for AWS App Mesh service meshes do not forward TCP traffic directly to services that aren't deployed with a proxy that is defined in the mesh. The rule is NON_COMPLIANT if configuration.Spec.EgressFilter.Type is set to 'ALLOW_ALL'.

Identifier: APPMESH_MESH_DENY_TCP_FORWARDING

Resource Types: AWS::AppMesh::Mesh

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appmesh-mesh-ip-pref-check

Checks if an AWS App Mesh mesh is configured with the specified IP preference for traffic control. The rule is NON_COMPLIANT if the App Mesh mesh is not configured with the IP preference specified in the required rule parameter.

Identifier: APPMESH_MESH_IP_PREF_CHECK

Resource Types: AWS::AppMesh::Mesh

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

ipPreference, Type: String

> The IP preference value for the rule to check. The rule is NON_COMPLIANT if an App Mesh mesh is configured with a value that does not match this value. Valid values include: 'IPv6_PREFERRED', 'IPv4_PREFERRED', 'IPv4_ONLY', and 'IPv6_ONLY'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appmesh-mesh-tagged

Checks if AWS App Mesh meshes have tags. Optionally, you can specify tag keys for the rule to check. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: APPMESH_MESH_TAGGED

Resource Types: AWS::AppMesh::Mesh

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appmesh-route-tagged

Checks if AWS App Mesh routes have tags. Optionally, you can specify tag keys for the rule to check. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: APPMESH_ROUTE_TAGGED

Resource Types: AWS::AppMesh::Route

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific

(Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appmesh-virtual-gateway-backend-defaults-tls

Checks if backend defaults for AWS App Mesh virtual gateways require the virtual gateways to communicate with all ports using TLS. The rule is NON_COMPLIANT if configuration.Spec.BackendDefaults.ClientPolicy.Tls.Enforce is false.

Identifier: APPMESH_VIRTUAL_GATEWAY_BACKEND_DEFAULTS_TLS

Resource Types: AWS::AppMesh::VirtualGateway

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appmesh-virtual-gateway-listeners-health-check-enabled

Checks if listeners for AWS App Mesh virtual gateways have health check enabled. The rule is NON_COMPLIANT if configuration.Spec.Listeners[].HealthCheck does not exist in one or more listeners.

Identifier: APPMESH_VIRTUAL_GATEWAY_LISTENERS_HEALTH_CHECK_ENABLED

Resource Types: AWS::AppMesh::VirtualGateway

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appmesh-virtual-gateway-logging-file-path-exists

Checks if AWS App Mesh virtual gateways have a file path to write access logs to. The rule is NON_COMPLIANT if configuration.Spec.Logging.AccessLog.File.Path does not exist.

Identifier: APPMESH_VIRTUAL_GATEWAY_LOGGING_FILE_PATH_EXISTS

Resource Types: AWS::AppMesh::VirtualGateway

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific

(Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appmesh-virtual-gateway-tagged

Checks if AWS App Mesh virtual gateways have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: APPMESH_VIRTUAL_GATEWAY_TAGGED

Resource Types: AWS::AppMesh::VirtualGateway

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appmesh-virtual-node-backend-defaults-tls-on

Checks if backend defaults for AWS App Mesh virtual nodes require the virtual nodes to communicate with all ports using TLS. The rule is NON_COMPLIANT if configuration.Spec.BackendDefaults.ClientPolicy.Tls.Enforce is false.

Identifier: APPMESH_VIRTUAL_NODE_BACKEND_DEFAULTS_TLS_ON

Resource Types: AWS::AppMesh::VirtualNode

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appmesh-virtual-node-cloud-map-ip-pref-check

Checks if an AWS App Mesh virtual node is configured with the specified IP preference for AWS Cloud Map service discovery. The rule is NON_COMPLIANT if the virtual node is not configured with the IP preference specified in the required rule parameter.

Identifier: APPMESH_VIRTUAL_NODE_CLOUD_MAP_IP_PREF_CHECK

Resource Types: AWS::AppMesh::VirtualNode

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific

(Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

ipPreference, Type: String

The IP preference value for AWS Cloud Map service discovery. The rule is NON_COMPLIANT if a virtual node is configured with a value that does not match this value. Valid values include: 'IPv6_PREFERRED', 'IPv4_PREFERRED', 'IPv4_ONLY', and 'IPv6_ONLY'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appmesh-virtual-node-dns-ip-pref-check

Checks if an AWS App Mesh virtual node is configured with the specified IP preference for DNS service discovery. The rule is NON_COMPLIANT if the virtual node is not configured with the IP preference specified in the required rule parameter.

Identifier: APPMESH_VIRTUAL_NODE_DNS_IP_PREF_CHECK

Resource Types: AWS::AppMesh::VirtualNode

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

ipPreference, Type: String

The IP preference value for DNS service discovery. The rule is NON_COMPLIANT if a virtual node is configured with a value that does not match this value. Valid values include: 'IPv6_PREFERRED', 'IPv4_PREFERRED', 'IPv4_ONLY', and 'IPv6_ONLY'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appmesh-virtual-node-listeners-health-check-enabled

Checks if listeners for AWS App Mesh virtual nodes have health check enabled. The rule is NON_COMPLIANT if configuration.Spec.Listeners[].HealthCheck does not exist in one or more listeners.

Identifier: APPMESH_VIRTUAL_NODE_LISTENERS_HEALTH_CHECK_ENABLED

Resource Types: AWS::AppMesh::VirtualNode

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appmesh-virtual-node-listeners-outlier-detect-enabled

Checks if listeners for AWS App Mesh virtual nodes have outlier detection enabled. The rule is NON_COMPLIANT if configuration.Spec.Listeners[].OutlierDetection does not exist in one or more listeners.

Identifier: APPMESH_VIRTUAL_NODE_LISTENERS_OUTLIER_DETECT_ENABLED

Resource Types: AWS::AppMesh::VirtualNode

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appmesh-virtual-node-logging-file-path-exists

Checks if AWS App Mesh virtual nodes have a file path to write access logs to. The rule is NON_COMPLIANT if configuration.Spec.Logging.AccessLog.File.Path does not exist.

Identifier: APPMESH_VIRTUAL_NODE_LOGGING_FILE_PATH_EXISTS

Resource Types: AWS::AppMesh::VirtualNode

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appmesh-virtual-node-service-backends-tls-enforced

Checks if service backends for AWS App Mesh virtual nodes require the virtual nodes to communicate with all ports using TLS. The rule is NON_COMPLIANT if any configuration.Spec.Backends[].ClientPolicy.Tls.Enforce is false.

Identifier: APPMESH_VIRTUAL_NODE_SERVICE_BACKENDS_TLS_ENFORCED

Resource Types: AWS::AppMesh::VirtualNode

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appmesh-virtual-node-tagged

Checks if AWS App Mesh virtual nodes have tags. Optionally, you can specify tag keys for the rule to check. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: APPMESH_VIRTUAL_NODE_TAGGED

Resource Types: AWS::AppMesh::VirtualNode

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific

(Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appmesh-virtual-router-tagged

Checks if AWS App Mesh virtual routers have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: APPMESH_VIRTUAL_ROUTER_TAGGED

Resource Types: AWS::AppMesh::VirtualRouter

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appmesh-virtual-service-tagged

Checks if AWS App Mesh virtual services have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: APPMESH_VIRTUAL_SERVICE_TAGGED

Resource Types: AWS::AppMesh::VirtualService

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

approved-amis-by-id

Checks if EC2 instances are using specified Amazon Machine Images (AMIs). Specify a list of approved AMI IDs. Running instances with AMIs that are not on this list are NON_COMPLIANT.

Identifier: APPROVED_AMIS_BY_ID

Resource Types: AWS::EC2::Instance

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

amiIds, Type: CSV

Comma-separated list of AMI IDs. There is a 1024 characters limit.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

approved-amis-by-tag

Checks if EC2 instances are using specified Amazon Machine Images (AMIs). Specify the tags that identify the AMIs. Running instances with AMIs that don't have at least one of the specified tags are NON_COMPLIANT.

Identifier: APPROVED_AMIS_BY_TAG

Resource Types: AWS::EC2::Instance

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

amisByTagKeyAndValue, Type: StringMap, Default: tag-key:tag-value,other-tag-key

Comma-separated list of up to 10 AMIs tags (tag-key:tag-value). For example, tag-key1 matches AMIs with tag-key1; tag-key2:value2 matches tag-key2 with the value 2.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

apprunner-service-in-vpc

Checks if AWS App Runner services route egress traffic through custom VPC. The rule is NON_COMPLIANT if configuration.NetworkConfiguration.EgressConfiguration.EgressType is equal to DEFAULT.

Identifier: APPRUNNER_SERVICE_IN_VPC

Resource Types: AWS::AppRunner::Service

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

apprunner-service-ip-address-type-check

Checks if an AWS App Runner service is configured with the specified IP address type for incoming public network configuration. The rule is NON_COMPLIANT if the service is not configured with the IP address type specified in the required rule parameter.

Identifier: APPRUNNER_SERVICE_IP_ADDRESS_TYPE_CHECK

Resource Types: AWS::AppRunner::Service

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

ipAddressType, Type: String

The IP address type value for the rule to check. The rule is NON_COMPLIANT if an AWS App Runner service is configured with a value that does not match this value. Valid values include: 'IPV4', 'DUAL_STACK'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

apprunner-service-max-unhealthy-threshold

Checks if an AWS App Runner service is configured to have an unhealthy threshold less than or equal to the specified value. The rule is NON_COMPLIANT if the unhealthy threshold is greater than the value specified in the required rule parameter.

Identifier: APPRUNNER_SERVICE_MAX_UNHEALTHY_THRESHOLD

Resource Types: AWS::AppRunner::Service

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

maxUnhealthyThreshold, Type: int

The maximum unhealthy threshold value for the rule to check. The rule is NON_COMPLIANT if an AWS App Runner service is configured with an unhealthy threshold greater than this value. Valid values are 1 to 20

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

apprunner-service-no-public-access

Checks if AWS AppRunner Services are not publicly accessible. The rule is NON_COMPLIANT if service.configuration.NetworkConfiguration.IngressConfiguration.IsPubliclyAccessible is False.

Identifier: APPRUNNER_SERVICE_NO_PUBLIC_ACCESS

Resource Types: AWS::AppRunner::Service

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

apprunner-service-observability-enabled

Checks if AWS App Runner services have observability enabled. The rule is NON_COMPLIANT if configuration.ObservabilityConfiguration.ObservabilityEnabled is false'.

Identifier: APPRUNNER_SERVICE_OBSERVABILITY_ENABLED

Resource Types: AWS::AppRunner::Service

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

apprunner-service-tagged

Checks if AWS App Runner services have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: APPRUNNER_SERVICE_TAGGED

Resource Types: AWS::AppRunner::Service

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

apprunner-vpc-connector-tagged

Checks if AWS App Runner VPC connectors have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: APPRUNNER_VPC_CONNECTOR_TAGGED

Resource Types: AWS::AppRunner::VpcConnector

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appstream-fleet-in-vpc

Checks if Amazon AppStream 2.0 fleets use an Amazon Virtual Private Cloud (Amazon VPC). The rule is NON_COMPLIANT if configuration.VpcConfig does not exist. The rule does not check Elastic fleets.

Identifier: APPSTREAM_FLEET_IN_VPC

Resource Types: AWS::AppStream::Fleet

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appsync-associated-with-waf

Checks if AWS AppSync APIs are associated with AWS WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT for an AWS AppSync API if it is not associated with a web ACL.

Identifier: APPSYNC_ASSOCIATED_WITH_WAF

Resource Types: AWS::AppSync::GraphQLApi

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

wafWebAclARNs (Optional), Type: CSV

Comma-separated list of Amazon Resource Names (ARNs) for authorized web ACLs.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appsync-authorization-check

Checks if an AWS AppSync API is using allowed authorization mechanisms. The rule is NON_COMPLIANT if an unapproved authorization mechanism is being used.

Identifier: APPSYNC_AUTHORIZATION_CHECK

Resource Types: AWS::AppSync::GraphQLApi

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

AllowedAuthorizationTypes, Type: CSV

> Comma-separated list of allowed AWS AppSync authorization mechanisms. Allowed values are: 'API_KEY', 'AWS_LAMBDA', 'AWS_IAM', 'OPENID_CONNECT', 'AMAZON_COGNITO_USER_POOLS'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appsync-cache-ct-encryption-at-rest

Checks if an AWS AppSync API cache has encryption at rest enabled. This rule is NON_COMPLIANT if 'AtRestEncryptionEnabled' is false.

Identifier: APPSYNC_CACHE_CT_ENCRYPTION_AT_REST

Resource Types: AWS::AppSync::ApiCache

Trigger type: Configuration changes

AWS Region: Only available in Middle East (Bahrain), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appsync-cache-ct-encryption-in-transit

Checks if an AWS AppSync API cache has encryption in transit enabled. The rule is NON_COMPLIANT if 'TransitEncryptionEnabled' is false.

Identifier: APPSYNC_CACHE_CT_ENCRYPTION_IN_TRANSIT

Resource Types: AWS::AppSync::ApiCache

Trigger type: Configuration changes

AWS Region: Only available in Middle East (Bahrain), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appsync-cache-encryption-at-rest

Checks if an AWS AppSync API cache has encryption at rest enabled. This rule is NON_COMPLIANT if 'AtRestEncryptionEnabled' is false.

Identifier: APPSYNC_CACHE_ENCRYPTION_AT_REST

Resource Types: AWS::AppSync::GraphQLApi

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appsync-graphql-api-xray-enabled

Checks if AWS AppSync GraphQL APIs have AWS X-Ray tracing enabled. The rule is NON_COMPLIANT if configuration.XrayEnabled is false.

Identifier: APPSYNC_GRAPHQL_API_XRAY_ENABLED

Resource Types: AWS::AppSync::GraphQLApi

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

appsync-logging-enabled

Checks if an AWS AppSync API has field level logging enabled. The rule is NON_COMPLIANT if field level logging is not enabled, or if the field logging levels for the AppSync API do not match the values specified in the '`fieldLoggingLevel`' parameter.

Identifier: APPSYNC_LOGGING_ENABLED

Resource Types: AWS::AppSync::GraphQLApi

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

fieldLoggingLevel (Optional), Type: CSV

Comma-separated list of field logging levels for the rule to check. For example, "ERROR, INFO".

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

aps-rule-groups-namespace-tagged

Checks if Amazon Managed Service for Prometheus rule groups namepaces have tags. You can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: APS_RULE_GROUPS_NAMESPACE_TAGGED

Resource Types: AWS::APS::RuleGroupsNamespace

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Asia

Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

athena-data-catalog-description

Checks if Amazon Athena data catalogs have a description. The rule is NON_COMPLIANT if configuration.Description does not exist.

Identifier: ATHENA_DATA_CATALOG_DESCRIPTION

Resource Types: AWS::Athena::DataCatalog

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

athena-prepared-statement-description

Checks if Amazon Athena prepared statements have a description. The rule is NON_COMPLIANT if configuration.Description does not exist.

Identifier: ATHENA_PREPARED_STATEMENT_DESCRIPTION

Resource Types: AWS::Athena::PreparedStatement

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Europe (Milan), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

athena-workgroup-description

Checks if Amazon Athena workgroups have a description. The rule is NON_COMPLIANT if configuration.Description does not exist or is an empty string.

Identifier: ATHENA_WORKGROUP_DESCRIPTION

Resource Types: AWS::Athena::WorkGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

athena-workgroup-encrypted-at-rest

Checks if an Amazon Athena workgroup is encrypted at rest. The rule is NON_COMPLIANT if encryption of data at rest is not enabled for an Athena workgroup.

Identifier: ATHENA_WORKGROUP_ENCRYPTED_AT_REST

Resource Types: AWS::Athena::WorkGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

athena-workgroup-enforce-workgroup-configuration

Checks if Amazon Athena workgroups using Athena engine enforce workgroup configuration to override client-side settings. The rule is NON_COMPLIANT if configuration.WorkGroupConfiguration.EnforceWorkGroupConfiguration is false.

Identifier: ATHENA_WORKGROUP_ENFORCE_WORKGROUP_CONFIGURATION

Resource Types: AWS::Athena::WorkGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

athena-workgroup-engine-version-auto-upgrade

Checks if Amazon Athena workgroups using Athena engine are configured to auto upgrade. The rule is NON_COMPLIANT if configuration.WorkGroupConfiguration.EngineVersion.SelectedEngineVersion is not 'AUTO'.

Identifier: ATHENA_WORKGROUP_ENGINE_VERSION_AUTO_UPGRADE

Resource Types: AWS::Athena::WorkGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

athena-workgroup-logging-enabled

Checks if Amazon Athena WorkGroup publishes usage metrics to Amazon CloudWatch. The rule is NON_COMPLIANT if an Amazon Athena WorkGroup 'PublishCloudWatchMetricsEnabled' is set to false.

Identifier: ATHENA_WORKGROUP_LOGGING_ENABLED

Resource Types: AWS::Athena::WorkGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Mexico (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

auditmanager-assessment-tagged

Checks if AWS Audit Manager assessments have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: AUDITMANAGER_ASSESSMENT_TAGGED

Resource Types: AWS::AuditManager::Assessment

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

aurora-global-database-deletion-protection-enabled

Checks if an Amazon Aurora Global cluster has deletion protection enabled. The rule is NON_COMPLIANT if configuration.DeletionProtection is false.

Identifier: AURORA_GLOBAL_DATABASE_DELETION_PROTECTION_ENABLED

Resource Types: AWS::RDS::GlobalCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Middle East (Bahrain), China (Beijing), Middle East (UAE), AWS GovCloud (US-East), AWS GovCloud (US-West), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

aurora-global-database-encryption-at-rest

Checks if Amazon Aurora Global Databases have storage encryption enabled. This rule is NON_COMPLIANT if an Amazon Aurora Global Database does not have storage encryption enabled.

Identifier: AURORA_GLOBAL_DATABASE_ENCRYPTION_AT_REST

Resource Types: AWS::RDS::GlobalCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

aurora-global-database-tagged

Checks if Amazon Aurora global clusters have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: AURORA_GLOBAL_DATABASE_TAGGED

Resource Types: AWS::RDS::GlobalCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Middle East (Bahrain), China (Beijing), Middle East (UAE), AWS GovCloud (US-East), AWS GovCloud (US-West), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

aurora-last-backup-recovery-point-created

Checks if a recovery point was created for Amazon Aurora DB clusters. The rule is NON_COMPLIANT if the Amazon Relational Database Service (Amazon RDS) DB Cluster does not have a corresponding recovery point created within the specified time period.

Identifier: AURORA_LAST_BACKUP_RECOVERY_POINT_CREATED

Resource Types: AWS::RDS::DBCluster

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

recoveryPointAgeUnit (Optional), Type: String, Default: days

Unit of time for maximum allowed age. Accepted values: 'hours', 'days'.

recoveryPointAgeValue (Optional), Type: int, Default: 1

Numerical value for maximum allowed age. No more than 744 for hours, 31 for days.

resourceId (Optional), Type: String

ID of Aurora DB cluster for the rule to check.

resourceTags (Optional), Type: String

Tags of Aurora DB clusters for the rule to check, in JSON format `{"tagkey" : "tagValue"}`.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

aurora-meets-restore-time-target

Checks if the restore time of Amazon Aurora DB clusters meets the specified duration. The rule is NON_COMPLIANT if LatestRestoreExecutionTimeMinutes of an Aurora DB Cluster is greater than maxRestoreTime minutes.

Identifier: AURORA_MEETS_RESTORE_TIME_TARGET

Resource Types: AWS::RDS::DBCluster

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

maxRestoreTime, Type: int

Numerical value for the maximum allowed restore runtime.

resourceId (Optional), Type: String

ID of Aurora DB cluster for the rule to check.

resourceTags (Optional), Type: String

Tags of Aurora DB clusters for the rule to check, in JSON format.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

aurora-mysql-backtracking-enabled

Checks if an Amazon Aurora MySQL cluster has backtracking enabled. The rule is NON_COMPLIANT if the Aurora cluster uses MySQL and it does not have backtracking enabled.

Identifier: AURORA_MYSQL_BACKTRACKING_ENABLED

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Europe (Stockholm), Middle East (Bahrain), China (Beijing), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), South America (Sao Paulo), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Europe (Milan), AWS GovCloud (US-East), AWS GovCloud (US-West), Israel (Tel Aviv), Canada West (Calgary), Europe (Spain) Region

Parameters:

BacktrackWindowInHours (Optional), Type: double

Amount of time in hours (up to 72) to backtrack your Aurora MySQL cluster.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

aurora-mysql-cluster-audit-logging

Checks if Amazon Aurora MySQL DB clusters have audit logging enabled. The rule is NON_COMPLIANT if a DB cluster does not have audit logging enabled.

Identifier: AURORA_MYSQL_CLUSTER_AUDIT_LOGGING

Resource Types: AWS::RDS::DBCluster

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Asia Pacific (Taipei) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

aurora-resources-in-logically-air-gapped-vault

Checks if Amazon Aurora DB clusters are in a logically air-gapped vault. The rule is NON_COMPLIANT if an Amazon Aurora DB cluster is not in a logically air-gapped vault within the specified time period.

Identifier: AURORA_RESOURCES_IN_LOGICALLY_AIR_GAPPED_VAULT

Resource Types: AWS::RDS::DBCluster

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

recoveryPointAgeUnit (Optional), Type: String, Default: days

Unit of time for maximum allowed age. Accepted values: 'hours', 'days'.

recoveryPointAgeValue (Optional), Type: int, Default: 1

Numerical value for maximum allowed age. No more than 2184 for hours, 91 for days.

resourceId (Optional), Type: String

ID of Aurora DB cluster for the rule to check.

resourceTags (Optional), Type: String

Tags of Aurora DB clusters for the rule to check, in JSON format.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

aurora-resources-protected-by-backup-plan

Checks if Amazon Aurora DB clusters are protected by a backup plan. The rule is NON_COMPLIANT if the Amazon Relational Database Service (Amazon RDS) Database Cluster is not protected by a backup plan.

Identifier: AURORA_RESOURCES_PROTECTED_BY_BACKUP_PLAN

Resource Types: AWS::RDS::DBCluster

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

backupVaultLockCheck (Optional), Type: String

Accepted values: 'True' or 'False'. Enter 'True' for the rule to check if the resource is backed up in a locked vault

crossAccountList (Optional), Type: String

Comma-separated list of destination accounts for cross-account backup copy to be kept

crossRegionList (Optional), Type: String

Comma-separated list of destination regions for the cross-region backup copy to be kept

maxRetentionDays (Optional), Type: int

The maximum retention period in days for the Backup Vault Lock

minRetentionDays (Optional), Type: int

The minimum retention period in days for the Backup Vault Lock

resourceId (Optional), Type: String

ID of Aurora DB cluster for the rule to check.

resourceTags (Optional), Type: String

Tags of Aurora DB clusters for the rule to check, in JSON format `{"tagkey" : "tagValue"}`.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

autoscaling-capacity-rebalancing

Checks if Capacity Rebalancing is enabled for Amazon EC2 Auto Scaling groups that use multiple instance types. The rule is NON_COMPLIANT if capacity Rebalancing is not enabled.

Identifier: AUTOSCALING_CAPACITY_REBALANCING

Resource Types: AWS::AutoScaling::AutoScalingGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

autoscaling-group-elb-healthcheck-required

Checks if your Amazon EC2 Auto Scaling groups that are associated with an Elastic Load Balancer use Elastic Load Balancing health checks. The rule is NON_COMPLIANT if the Amazon EC2 Auto Scaling groups are not using Elastic Load Balancing health checks.

Identifier: AUTOSCALING_GROUP_ELB_HEALTHCHECK_REQUIRED

Resource Types: AWS::AutoScaling::AutoScalingGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

Proactive Evaluation

For steps on how to run this rule in proactive mode, see Evaluating Your Resources with AWS Config Rules. For this rule to return COMPLIANT in proactive mode, the resource configuration schema for the StartResourceEvaluation API needs to include the following inputs, encoded as a string:

```
"ResourceConfiguration":
...
{
   "LoadBalancerNames": "[my-load-balancer-1, my-load-balancer-2, my-load-
balancer-3, ...]",
   "HealthCheckType": HealthCheckType*"
}
...
```

*The valid values are `EC2` (default), `ELB`, and `VPC_LATTICE`. The `VPC_LATTICE` health check type is reserved for use with VPC Lattice, which is in preview release and is subject to change. For more information, see Health checks for Auto Scaling instances in the Amazon EC2 Auto Scaling User Guide.

For more information on proactive evaluation, see Evaluation Mode.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

autoscaling-launchconfig-requires-imdsv2

Checks whether only IMDSv2 is enabled. This rule is NON_COMPLIANT if the Metadata version is not included in the launch configuration or if both Metadata V1 and V2 are enabled.

Identifier: AUTOSCALING_LAUNCHCONFIG_REQUIRES_IMDSV2

Resource Types: AWS::AutoScaling::LaunchConfiguration

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Mexico (Central), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

autoscaling-launch-config-hop-limit

Checks the number of network hops that the metadata token can travel. This rule is NON_COMPLIANT if the Metadata response hop limit is greater than 1.

Identifier: AUTOSCALING_LAUNCH_CONFIG_HOP_LIMIT

Resource Types: AWS::AutoScaling::LaunchConfiguration

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Jakarta), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

autoscaling-launch-config-public-ip-disabled

Checks if Amazon EC2 Auto Scaling groups have public IP addresses enabled through Launch Configurations. The rule is NON_COMPLIANT if the Launch Configuration for an Amazon EC2 Auto Scaling group has AssociatePublicIpAddress set to 'true'.

Identifier: AUTOSCALING_LAUNCH_CONFIG_PUBLIC_IP_DISABLED

Resource Types: AWS::AutoScaling::LaunchConfiguration

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

autoscaling-launch-template

Checks if an Amazon Elastic Compute Cloud (EC2) Auto Scaling group is created from an EC2 launch template. The rule is NON_COMPLIANT if the scaling group is not created from an EC2 launch template.

Identifier: AUTOSCALING_LAUNCH_TEMPLATE

Resource Types: AWS::AutoScaling::AutoScalingGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

autoscaling-multiple-az

Checks if the Auto Scaling group spans multiple Availability Zones. The rule is NON_COMPLIANT if the Auto Scaling group does not span multiple Availability Zones.

Identifier: AUTOSCALING_MULTIPLE_AZ

Resource Types: AWS::AutoScaling::AutoScalingGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except AWS GovCloud (US-East), AWS GovCloud (US-West), Canada West (Calgary) Region

Parameters:

minAvailabilityZones (Optional), Type: int

Minimum number of expected Availability zones.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

autoscaling-multiple-instance-types

Checks if an Amazon EC2 Auto Scaling group uses multiple instance types. The rule is NON_COMPLIANT if the Amazon EC2 Auto Scaling group has only one instance type defined. This rule does not evaluate attribute-based instance types.

Identifier: AUTOSCALING_MULTIPLE_INSTANCE_TYPES

Resource Types: AWS::AutoScaling::AutoScalingGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

backup-plan-min-frequency-and-min-retention-check

Checks if a backup plan has a backup rule that satisfies the required frequency and retention period. The rule is NON_COMPLIANT if recovery points are not created at least as often as the specified frequency or expire before the specified period.

Identifier: BACKUP_PLAN_MIN_FREQUENCY_AND_MIN_RETENTION_CHECK

Resource Types: AWS::Backup::BackupPlan

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

requiredFrequencyUnit (Optional), Type: String, Default: days

Unit of time for required backup frequency. Accepted values: 'hours', 'days'.

requiredFrequencyValue (Optional), Type: int, Default: 1

Numerical value for required backup frequency. Maximum of 24 for hours, 31 for days.

requiredRetentionDays (Optional), Type: int, Default: 35

Required retention period in days.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

backup-recovery-point-encrypted

Checks if a recovery point is encrypted. The rule is NON_COMPLIANT if the recovery point is not encrypted.

Identifier: BACKUP_RECOVERY_POINT_ENCRYPTED

Resource Types: AWS::Backup::RecoveryPoint

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

backup-recovery-point-manual-deletion-disabled

Checks if a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

> **Note**
>
> **Wildcard required for `"Resource"` and `"Principal"` of the Deny statement**
> The rule requires that the `"Resource"` and `"Principal"` of the Deny statement must have a wildcard in the vault access policy. Otherwise, the rule returns NON_COMPLIANT.

Identifier: BACKUP_RECOVERY_POINT_MANUAL_DELETION_DISABLED

Resource Types: AWS::Backup::BackupVault

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

principalArnList (Optional), Type: CSV

Comma-separated list of AWS Identity and Access Management (IAM) Amazon Resource Names (ARNs) for the rule to NOT check.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

backup-recovery-point-minimum-retention-check

Checks if a recovery point expires no earlier than after the specified period. The rule is NON_COMPLIANT if the recovery point has a retention point that is less than the required retention period.

Identifier: BACKUP_RECOVERY_POINT_MINIMUM_RETENTION_CHECK

Resource Types: AWS::Backup::RecoveryPoint

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

requiredRetentionDays (Optional), Type: int, Default: 35

Required retention period in days.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

batch-compute-environment-enabled

Checks if AWS Batch compute environments are enabled. The rule is NON_COMPLIANT if configuration.State is 'DISABLED'.

Identifier: BATCH_COMPUTE_ENVIRONMENT_ENABLED

Resource Types: AWS::Batch::ComputeEnvironment

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

batch-compute-environment-managed

Checks if AWS Batch compute environments are managed. The rule is NON_COMPLIANT if configuration.Type is 'UNMANAGED'.

Identifier: BATCH_COMPUTE_ENVIRONMENT_MANAGED

Resource Types: AWS::Batch::ComputeEnvironment

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

batch-compute-environment-tagged

Checks if AWS Batch compute environments have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: BATCH_COMPUTE_ENVIRONMENT_TAGGED

Resource Types: AWS::Batch::ComputeEnvironment

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

batch-job-queue-enabled

Checks if AWS Batch job queues are enabled. The rule is NON_COMPLIANT if configuration.State is 'DISABLED'.

Identifier: BATCH_JOB_QUEUE_ENABLED

Resource Types: AWS::Batch::JobQueue

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

batch-job-queue-tagged

Checks if AWS Batch job queues have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: BATCH_JOB_QUEUE_TAGGED

Resource Types: AWS::Batch::JobQueue

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

batch-managed-compute-environment-using-launch-template

Checks if AWS Batch managed compute environments are configured using a launch template. The rule is NON_COMPLIANT if configuration.ComputeResources.LaunchTemplate does not exist.

Identifier: BATCH_MANAGED_COMPUTE_ENVIRONMENT_USING_LAUNCH_TEMPLATE

Resource Types: AWS::Batch::ComputeEnvironment

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

batch-managed-compute-env-allocation-strategy-check

Checks if an AWS Batch managed compute environment is configured with a specified allocation strategy. The rule is NON_COMPLIANT if the compute environment is not configured with an allocation strategy specified in the required rule parameter.

Identifier: BATCH_MANAGED_COMPUTE_ENV_ALLOCATION_STRATEGY_CHECK

Resource Types: AWS::Batch::ComputeEnvironment

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

allocationStrategy, Type: CSV

> Comma-separated list of allocation strategies for the rule to check. Valid values include: 'BEST_FIT', 'BEST_FIT_PROGRESSIVE', 'SPOT_CAPACITY_OPTIMIZED', and 'SPOT_PRICE_CAPACITY_OPTIMIZED'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

batch-managed-compute-env-compute-resources-tagged

Checks if AWS Batch managed compute environments compute resources have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. Tags starting with 'aws:' are not checked.

Identifier: BATCH_MANAGED_COMPUTE_ENV_COMPUTE_RESOURCES_TAGGED

Resource Types: AWS::Batch::ComputeEnvironment

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

batch-managed-spot-compute-environment-max-bid

Checks if an AWS Batch managed Spot compute environment is configured to have a bid percentage less than or equal to the specified value. The rule is NON_COMPLIANT if the bid percentage is greater than the value specified in the required rule parameter.

Identifier: BATCH_MANAGED_SPOT_COMPUTE_ENVIRONMENT_MAX_BID

Resource Types: AWS::Batch::ComputeEnvironment

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

maxBidPercentage, Type: int

The maximum bid percentage value for the rule to check. The rule is NON_COMPLIANT if an AWS Batch managed Spot compute environment is configured with a bid percentage greater than this value. Valid values are 1 to 100.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

batch-scheduling-policy-tagged

Checks if AWS Batch scheduling policies have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: BATCH_SCHEDULING_POLICY_TAGGED

Resource Types: AWS::Batch::SchedulingPolicy

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

beanstalk-enhanced-health-reporting-enabled

Checks if an AWS Elastic Beanstalk environment is configured for enhanced health reporting. The rule is COMPLIANT if the environment is configured for enhanced health reporting. The rule is NON_COMPLIANT if the environment is configured for basic health reporting.

Identifier: BEANSTALK_ENHANCED_HEALTH_REPORTING_ENABLED

Resource Types: AWS::ElasticBeanstalk::Environment

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

bedrockagentcore-browsercustom-network-mode-not-public

Checks if an Amazon Bedrock AgentCore custom browser is configured with public network mode. The rule is NON_COMPLIANT if the NetworkMode is set to PUBLIC.

Identifier: BEDROCKAGENTCORE_BROWSERCUSTOM_NETWORK_MODE_NOT_PUBLIC

Resource Types: AWS::BedrockAgentCore::BrowserCustom

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

bedrockagentcore-browsercustom-recording-enabled

Checks if an Amazon Bedrock AgentCore custom browser has session recording enabled with an S3 destination. The rule is NON_COMPLIANT if recording is disabled or not configured.

Identifier: BEDROCKAGENTCORE_BROWSERCUSTOM_RECORDING_ENABLED

Resource Types: AWS::BedrockAgentCore::BrowserCustom

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

bedrockagentcore-codeinterpreter-networkmode-check

Checks if an Amazon Bedrock AgentCore CodeInterpreterCustom is configured with a private network mode. The rule is NON_COMPLIANT if the CodeInterpreterCustom has NetworkMode set to PUBLIC or SANDBOX.

Identifier: BEDROCKAGENTCORE_CODEINTERPRETER_NETWORKMODE_CHECK

Resource Types: AWS::BedrockAgentCore::CodeInterpreterCustom

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

bedrockagentcore-gateway-authorizer-enabled

Checks whether an Amazon Bedrock AgentCore Gateway requires authentication for inbound requests. The rule is NON_COMPLIANT if the gateway has AuthorizerType set to NONE.

Identifier: BEDROCKAGENTCORE_GATEWAY_AUTHORIZER_ENABLED

Resource Types: AWS::BedrockAgentCore::Gateway

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

bedrockagentcore-gateway-encryption-enabled

Checks whether an Amazon Bedrock AgentCore Gateway is encrypted with a customer-managed KMS key. The rule is NON_COMPLIANT if the gateway does not have KmsKeyArn configured.

Identifier: BEDROCKAGENTCORE_GATEWAY_ENCRYPTION_ENABLED

Resource Types: AWS::BedrockAgentCore::Gateway

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

bedrockagentcore-runtime-private-network-required

Checks if an Amazon Bedrock AgentCore runtime is configured with public network access. The rule is NON_COMPLIANT if the runtime has NetworkMode set to PUBLIC.

Identifier: BEDROCKAGENTCORE_RUNTIME_PRIVATE_NETWORK_REQUIRED

Resource Types: AWS::BedrockAgentCore::Runtime

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

bedrock-agentcore-memory-encryption-enabled

Checks whether Amazon Bedrock AgentCore Memory uses customer-managed KMS key for encryption. The rule is NON_COMPLIANT if AgentCore Memory does not have EncryptionKeyArn configured.

Identifier: BEDROCK_AGENTCORE_MEMORY_ENCRYPTION_ENABLED

Resource Types: AWS::BedrockAgentCore::Memory

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Tokyo), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

bedrock-agentcore-memory-event-expiry-duration

Checks whether Amazon Bedrock AgentCore Memory event expiry duration meets the minimum required days. The rule is NON_COMPLIANT if AgentCore Memory has EventExpiryDuration set to less than the minimum required value.

Identifier: BEDROCK_AGENTCORE_MEMORY_EVENT_EXPIRY_DURATION

Resource Types: AWS::BedrockAgentCore::Memory

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

minEventExpiryDuration (Optional), Type: int, Default: 7

Minimum number of days for the event expiry duration. Default is 7 days.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

bedrock-data-source-encryption-enabled

Checks whether an Amazon Bedrock data source is encrypted with a customer-managed KMS key. The rule is NON_COMPLIANT if the data source does not have ServerSideEncryptionConfiguration.KmsKeyArn configured.

Identifier: BEDROCK_DATA_SOURCE_ENCRYPTION_ENABLED

Resource Types: AWS::Bedrock::DataSource

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Middle East (Bahrain), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hong Kong), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), US West (N. California), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cassandra-keyspace-tagged

Checks if Amazon Keyspaces (for Apache Cassandra) keyspaces have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: CASSANDRA_KEYSPACE_TAGGED

Resource Types: AWS::Cassandra::Keyspace

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Middle East (Bahrain), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

clb-desync-mode-check

Checks if Classic Load Balancers (CLB) are configured with a user defined Desync mitigation mode. The rule is NON_COMPLIANT if CLB Desync mitigation mode does not match with user defined Desync mitigation mode.

Identifier: CLB_DESYNC_MODE_CHECK

Resource Types: AWS::ElasticLoadBalancing::LoadBalancer

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

desyncMode, Type: CSV

> Comma-separated list of values. You can select a max of two. Valid values include 'Defensive', 'Strictest', and 'Monitor'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

clb-multiple-az

Checks if a Classic Load Balancer spans multiple Availability Zones (AZs). The rule is NON_COMPLIANT if a Classic Load Balancer spans less than 2 AZs or does not span number of AZs mentioned in the `minAvailabilityZones` parameter (if provided).

Identifier: CLB_MULTIPLE_AZ

Resource Types: AWS::ElasticLoadBalancing::LoadBalancer

Trigger type: Configuration changes

AWS Region: All supported AWS regions except AWS GovCloud (US-East), AWS GovCloud (US-West) Region

Parameters:

minAvailabilityZones (Optional), Type: int

Desired minimum number of expected AZs. Valid values are between 2 and 10, both inclusive. Default value is 2 if parameter is not specified.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudformation-stack-drift-detection-check

Checks if the actual configuration of a AWS CloudFormation (CloudFormation) stack differs, or has drifted, from the expected configuration. A stack is considered to have drifted if one or more of its resources differ from their expected configuration. The rule and the stack are COMPLIANT when the stack drift status is IN_SYNC. The rule is NON_COMPLIANT if the stack drift status is DRIFTED.

> **Note**
>
> This rule performs the DetectStackDrift operation on each stack in your account. The DetectStackDrift operation can take up to several minutes, depending on the number of resources contained within the stack. Given that the maximum execution time of this rule is limited to 15 mins, it is possible that the rule times out before it completes the evaluation of all the stacks in your account.
> If you encounter this issue, it is suggested that you to restrict the number of stacks in-scope for the rule, using tags. You can do the following:
>
> 1. Divide your stacks into groups, each with a different tag.
> 2. Apply the same tag to all the stacks in that group.
> 3. Have multiple instances of this rule in your account, each scoped by a different tag. This allows each instance of the rule to only process the stacks which have the corresponding tag mentioned in its scope.

Identifier: CLOUDFORMATION_STACK_DRIFT_DETECTION_CHECK

Resource Types: AWS::CloudFormation::Stack

Trigger type: Configuration changes and Periodic

AWS Region: All supported AWS regions except Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Israel (Tel Aviv), Europe (Spain) Region

Parameters:

cloudformationRoleArn, Type: String

The Amazon Resource Name (ARN) of the IAM role with policy permissions to detect drift for CloudFormation stacks. For information on required IAM permissions for the role, see Detecting unmanaged configuration changes to stacks and resources | Considerations when detecting drift in the *CloudFormation User Guide*.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudformation-stack-notification-check

Checks if your CloudFormation stacks send event notifications to an Amazon SNS topic. Optionally checks if specified Amazon SNS topics are used. The rule is NON_COMPLIANT if CloudFormation stacks do not send notifications.

Identifier: CLOUDFORMATION_STACK_NOTIFICATION_CHECK

Resource Types: AWS::CloudFormation::Stack

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Israel (Tel Aviv), Europe (Spain) Region

Parameters:

snsTopic1 (Optional), Type: String

SNS topic ARN.

snsTopic2 (Optional), Type: String

SNS topic ARN.

snsTopic3 (Optional), Type: String

SNS topic ARN.

snsTopic4 (Optional), Type: String

SNS topic ARN.

snsTopic5 (Optional), Type: String

SNS topic ARN.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudformation-stack-service-role-check

Checks if AWS CloudFormation stacks are using service roles. The rule is NON_COMPLIANT if a CloudFormation stack does not have service role associated with it.

Identifier: CLOUDFORMATION_STACK_SERVICE_ROLE_CHECK

Resource Types: AWS::CloudFormation::Stack

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Israel (Tel Aviv), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudformation-termination-protection-check

Checks if an AWS CloudFormation stack has termination protection enabled. This rule is NON_COMPLIANT if termination protection is not enabled on a CloudFormation stack.

Identifier: CLOUDFORMATION_TERMINATION_PROTECTION_CHECK

Resource Types: AWS::CloudFormation::Stack

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Israel (Tel Aviv), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudfront-accesslogs-enabled

Checks if Amazon CloudFront distributions are configured to deliver access logs to an Amazon S3 bucket using standard logging (legacy). The rule is NON_COMPLIANT if a CloudFront distribution does not have legacy logging configured.

Identifier: CLOUDFRONT_ACCESSLOGS_ENABLED

Resource Types: AWS::CloudFront::Distribution

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

S3BucketName (Optional), Type: String

The name of the Amazon S3 bucket for storing server access logs

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudfront-associated-with-waf

Checks if Amazon CloudFront distributions are associated with either web application firewall (WAF) or WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT if a CloudFront distribution is not associated with a WAF web ACL.

Identifier: CLOUDFRONT_ASSOCIATED_WITH_WAF

Resource Types: AWS::CloudFront::Distribution

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

wafWebAclIds (Optional), Type: CSV

Comma-separated list of web ACL IDs for WAF or web ACL Amazon Resource Names (ARNs) for WAFV2

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudfront-custom-ssl-certificate

Checks if the certificate associated with an Amazon CloudFront distribution is the default SSL certificate. The rule is NON_COMPLIANT if a CloudFront distribution uses the default SSL certificate. Multi-tenant distributions are not applicable.

Identifier: CLOUDFRONT_CUSTOM_SSL_CERTIFICATE

Resource Types: AWS::CloudFront::Distribution

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudfront-default-root-object-configured

Checks if an Amazon CloudFront distribution is configured to return a specific object that is the default root object. The rule is NON_COMPLIANT if Amazon CloudFront distribution does not have a default root object configured.

Identifier: CLOUDFRONT_DEFAULT_ROOT_OBJECT_CONFIGURED

Resource Types: AWS::CloudFront::Distribution

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudfront-distribution-key-group-enabled

Checks whether Amazon CloudFront distributions use only trusted key groups for signed URL or signed cookie authentication for all cache behaviors. The rule is NON_COMPLIANT if cache behaviors use trusted signers or no authentication is configured.

Identifier: CLOUDFRONT_DISTRIBUTION_KEY_GROUP_ENABLED

Resource Types: AWS::CloudFront::Distribution

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudfront-no-deprecated-ssl-protocols

Checks if CloudFront distributions are using deprecated SSL protocols for HTTPS communication between CloudFront edge locations and custom origins. This rule is NON_COMPLIANT for a CloudFront distribution if any 'OriginSslProtocols' includes 'SSLv3'.

Identifier: CLOUDFRONT_NO_DEPRECATED_SSL_PROTOCOLS

Resource Types: AWS::CloudFront::Distribution

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudfront-origin-access-identity-enabled

Checks if CloudFront distribution with Amazon S3 Origin type has origin access identity configured. The rule is NON_COMPLIANT if the CloudFront distribution is backed by S3 and any origin type is not OAI configured, or the origin is not an S3 bucket.

> **Note**
>
> The rule does not return `NOT_APPLICABLE` if the origin is not an S3 bucket.

Identifier: CLOUDFRONT_ORIGIN_ACCESS_IDENTITY_ENABLED

Resource Types: AWS::CloudFront::Distribution

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudfront-origin-failover-enabled

Checks if an origin group is configured for the distribution of at least two origins in the origin group for Amazon CloudFront. The rule is NON_COMPLIANT if there are no origin groups for the distribution.

Identifier: CLOUDFRONT_ORIGIN_FAILOVER_ENABLED

Resource Types: AWS::CloudFront::Distribution

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudfront-origin-lambda-url-oac-enabled

Checks if Amazon CloudFront distributions with Amazon Lambda Function URL origins have origin access control (OAC) enabled. The rule is NON_COMPLIANT if any Lambda Function URL origin in a CloudFront distribution does not have OAC enabled.

Identifier: CLOUDFRONT_ORIGIN_LAMBDA_URL_OAC_ENABLED

Resource Types: AWS::CloudFront::Distribution

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudfront-s3-origin-access-control-enabled

Checks if an Amazon CloudFront distribution with an Amazon Simple Storage Service (Amazon S3) Origin type has origin access control (OAC) enabled. The rule is NON_COMPLIANT for CloudFront distributions with Amazon S3 origins that don't have OAC enabled.

Identifier: CLOUDFRONT_S3_ORIGIN_ACCESS_CONTROL_ENABLED

Resource Types: AWS::CloudFront::Distribution

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudfront-s3-origin-non-existent-bucket

Checks if Amazon CloudFront distributions point to a non-existent S3 bucket. The rule is NON_COMPLIANT if `S3OriginConfig` for a CloudFront distribution points to a non-existent S3 bucket. The rule does not evaluate S3 buckets with static website hosting.

Identifier: CLOUDFRONT_S3_ORIGIN_NON_EXISTENT_BUCKET

Resource Types: AWS::CloudFront::Distribution

Trigger type: Periodic

AWS Region: Only available in Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), US East (N. Virginia), Asia Pacific (Malaysia), Israel (Tel Aviv), Asia Pacific (Taipei) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudfront-security-policy-check

Checks if Amazon CloudFront distributions are using a minimum security policy and cipher suite of TLSv1.2 or greater for viewer connections. This rule is NON_COMPLIANT for a CloudFront distribution if the minimumProtocolVersion is below TLSv1.2_2018.

Identifier: CLOUDFRONT_SECURITY_POLICY_CHECK

Resource Types: AWS::CloudFront::Distribution

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudfront-sni-enabled

Checks if Amazon CloudFront distributions are using a custom SSL certificate and are configured to use SNI to serve HTTPS requests. The rule is NON_COMPLIANT if a custom SSL certificate is associated but the SSL support method is a dedicated IP address.

Identifier: CLOUDFRONT_SNI_ENABLED

Resource Types: AWS::CloudFront::Distribution

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudfront-ssl-policy-check

Checks if Amazon CloudFront distributions are configured with the specified security policies.The rule is NON_COMPLIANT if a CloudFront Distribution is not configured with security policies that you specify.

Identifier: CLOUDFRONT_SSL_POLICY_CHECK

Resource Types: AWS::CloudFront::Distribution

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

securityPolicies, Type: CSV

> Comma-separated list of CloudFront distribution security policies for the rule to check. For example: "TLSv1.2_2018, TLSv1.2_2019, TLSv1.2_2021". For a list of valid value, see the Amazon CloudFront Developer Guide.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudfront-traffic-to-origin-encrypted

Checks if Amazon CloudFront distributions are encrypting traffic to custom origins. The rule is NON_COMPLIANT if ‘OriginProtocolPolicy’ is ‘http-only’ or if ‘OriginProtocolPolicy’ is ‘match-viewer’ and ‘ViewerProtocolPolicy’ is ‘allow-all’.

Identifier: CLOUDFRONT_TRAFFIC_TO_ORIGIN_ENCRYPTED

Resource Types: AWS::CloudFront::Distribution

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudfront-viewer-policy-https

Checks whether your Amazon CloudFront distributions use HTTPS (directly or via a redirection). The rule is NON_COMPLIANT if the value of ViewerProtocolPolicy is set to 'allow-all' for the defaultCacheBehavior or for the CacheBehaviors.

Identifier: CLOUDFRONT_VIEWER_POLICY_HTTPS

Resource Types: AWS::CloudFront::Distribution

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudtrail-all-read-s3-data-event-check

Checks if an AWS CloudTrail multi-Region trail is enabled and logs all read S3 data events for your buckets. The rule is NON_COMPLIANT if no multi-Region trail logs all read S3 data event types for all current and future S3 buckets.

Identifier: CLOUDTRAIL_ALL_READ_S3_DATA_EVENT_CHECK

Resource Types: AWS::::Account

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudtrail-all-write-s3-data-event-check

Checks if an AWS CloudTrail multi-Region trail is enabled and logs all write S3 data events for your buckets. The rule is NON_COMPLIANT if no multi-Region trail logs all write S3 data event types for all current and future S3 buckets.

Identifier: CLOUDTRAIL_ALL_WRITE_S3_DATA_EVENT_CHECK

Resource Types: AWS::::Account

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudtrail-event-data-store-multi-region

Checks if AWS CloudTrail event data stores have multi-region enabled when ingesting live events. The rule is NON_COMPLIANT if configuration.MultiRegionEnabled is false.

Identifier: CLOUDTRAIL_EVENT_DATA_STORE_MULTI_REGION

Resource Types: AWS::CloudTrail::EventDataStore

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudtrail-s3-bucket-access-logging

Checks if the S3 bucket configurations for your AWS CloudTrail logs have Amazon S3 server access logging enabled. The rule is NON_COMPLIANT if at least one S3 bucket for a CloudTrail trail does not have S3 server access logging enabled.

Identifier: CLOUDTRAIL_S3_BUCKET_ACCESS_LOGGING

Resource Types: AWS::CloudTrail::Trail

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudtrail-s3-bucket-public-access-prohibited

Checks if the S3 bucket configurations for your AWS CloudTrail logs block public access. The rule is NON_COMPLIANT if at least one S3 bucket for a CloudTrail trail is publicly accessible.

Identifier: CLOUDTRAIL_S3_BUCKET_PUBLIC_ACCESS_PROHIBITED

Resource Types: AWS::CloudTrail::Trail

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudtrail-s3-dataevents-enabled

Checks if at least one AWS CloudTrail trail is logging Amazon Simple Storage Service (Amazon S3) data events for all S3 buckets. The rule is NON_COMPLIANT if there are trails or if no trails record S3 data events.

Identifier: CLOUDTRAIL_S3_DATAEVENTS_ENABLED

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

S3BucketNames (Optional), Type: String

Comma-separated list of S3 bucket names for which data events logging should be enabled. Default behavior checks for all S3 buckets.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudtrail-security-trail-enabled

Checks that there is at least one AWS CloudTrail trail defined with security best practices. This rule is COMPLIANT if there is at least one trail that meets all of the following:

- records global service events
- is a multi-region trail
- has Log file validation enabled
- encrypted with a KMS key
- records events for reads and writes
- records management events
- does not exclude any management events

This rule is NON_COMPLIANT if no trails meet all of the criteria mentioned above.

Identifier: CLOUDTRAIL_SECURITY_TRAIL_ENABLED

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudwatch-alarm-action-check

Checks if CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally checks if any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Identifier: CLOUDWATCH_ALARM_ACTION_CHECK

Resource Types: AWS::CloudWatch::Alarm

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

alarmActionRequired, Type: String, Default: true

Alarms have at least one action.

insufficientDataActionRequired, Type: String, Default: true

Alarms have at least one action when the alarm transitions to the INSUFFICIENT_DATA state from any other state.

okActionRequired, Type: String, Default: false

Alarms have at least one action when the alarm transitions to an OK state from any other state.

action1 (Optional), Type: String

The action to execute, specified as an ARN.

action2 (Optional), Type: String

The action to execute, specified as an ARN.

action3 (Optional), Type: String

The action to execute, specified as an ARN.

action4 (Optional), Type: String

The action to execute, specified as an ARN.

action5 (Optional), Type: String

The action to execute, specified as an ARN.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudwatch-alarm-action-enabled-check

Checks if Amazon CloudWatch alarms actions are in enabled state. The rule is NON_COMPLIANT if the CloudWatch alarms actions are not in enabled state.

Identifier: CLOUDWATCH_ALARM_ACTION_ENABLED_CHECK

Resource Types: AWS::CloudWatch::Alarm

Trigger type: Configuration changes

AWS Region: All supported AWS regions except AWS GovCloud (US-East), AWS GovCloud (US-West) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudwatch-alarm-description

Checks if AWS CloudWatch Alarm resources contain an alarm description. The rule is NON_COMPLIANT if the CloudWatch Alarm resource does not contain an AlarmDescription field or the AlarmDescription is empty.

Identifier: CLOUDWATCH_ALARM_DESCRIPTION

Resource Types: AWS::CloudWatch::Alarm

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudwatch-alarm-resource-check

Checks if a resource type has a CloudWatch alarm for the named metric. For resource type, you can specify EBS volumes, EC2 instances, Amazon RDS clusters, or S3 buckets. The rule is COMPLIANT if the named metric has a resource ID and CloudWatch alarm.

Identifier: CLOUDWATCH_ALARM_RESOURCE_CHECK

Resource Types: AWS::EC2::Instance, AWS::RDS::DBCluster, AWS::S3::Bucket, AWS::EC2::Volume

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

metricName, Type: String

The name for the metric associated with the alarm (for example, 'CPUUtilization' for EC2 instances).

resourceType, Type: String

AWS resource type. The value can be one of the following: AWS::EC2::Volume, AWS::EC2::Instance, AWS::RDS::DBCluster, or AWS::S3::Bucket.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudwatch-alarm-settings-check

Checks whether CloudWatch alarms with the given metric name have the specified settings.

Identifier: CLOUDWATCH_ALARM_SETTINGS_CHECK

Resource Types: AWS::CloudWatch::Alarm

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

metricName, Type: String

The name for the metric associated with the alarm.

comparisonOperator (Optional), Type: String

The operation for comparing the specified statistic and threshold (for example, 'GreaterThanThreshold').

evaluationPeriods (Optional), Type: int

The number of periods over which data is compared to the specified threshold.

period (Optional), Type: int, Default: 300

The period, in seconds, during which the specified statistic is applied.

statistic (Optional), Type: String

The statistic for the metric associated with the alarm (for example, 'Average' or 'Sum').

threshold (Optional), Type: int

The value against which the specified statistic is compared.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudwatch-log-group-encrypted

Checks if Amazon CloudWatch Log Groups are encrypted with any AWS KMS key or a specified AWS KMS key Id. The rule is NON_COMPLIANT if a CloudWatch Log Group is not encrypted with a KMS key or is encrypted with a KMS key not supplied in the rule parameter.

Identifier: CLOUDWATCH_LOG_GROUP_ENCRYPTED

Resource Types: AWS::Logs::LogGroup

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

KmsKeyId (Optional), Type: String

Amazon Resource Name (ARN) of the ID for the KMS key that is used to encrypt the log group.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudwatch-metric-stream-tagged

Checks if Amazon CloudWatch metric streams have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: CLOUDWATCH_METRIC_STREAM_TAGGED

Resource Types: AWS::CloudWatch::MetricStream

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloud-trail-cloud-watch-logs-enabled

Checks if AWS CloudTrail trails are configured to send logs to CloudWatch logs. The trail is NON_COMPLIANT if the CloudWatchLogsLogGroupArn property of the trail is empty.

Identifier: CLOUD_TRAIL_CLOUD_WATCH_LOGS_ENABLED

Resource Types: AWS::CloudTrail::Trail

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

expectedDeliveryWindowAge (Optional), Type: int

Maximum age in hours of the most recent delivery to CloudWatch logs that satisfies compliance.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloudtrail-enabled

> **Important**
>
> For this rule, the rule identifier (CLOUD_TRAIL_ENABLED) and rule name (cloudtrail-enabled) are different.

Checks if an AWS CloudTrail trail is enabled in your AWS account. The rule is NON_COMPLIANT if a trail is not enabled. Optionally, the rule checks a specific S3 bucket, Amazon Simple Notification Service (Amazon SNS) topic, and CloudWatch log group.

Identifier: CLOUD_TRAIL_ENABLED

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

cloudWatchLogsLogGroupArn (Optional), Type: String

CloudWatch log group ARN for CloudTrail to send data to.

s3BucketName (Optional), Type: String

Name of S3 bucket for CloudTrail to deliver log files to.

snsTopicArn (Optional), Type: String

SNS topic ARN for CloudTrail to use for notifications.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloud-trail-encryption-enabled

Checks if AWS CloudTrail is configured to use the server side encryption (SSE) AWS Key Management Service (AWS KMS) encryption. The rule is COMPLIANT if the KmsKeyId is defined.

Identifier: CLOUD_TRAIL_ENCRYPTION_ENABLED

Resource Types: AWS::CloudTrail::Trail

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cloud-trail-log-file-validation-enabled

Checks if AWS CloudTrail creates a signed digest file with logs. AWS recommends that the file validation must be enabled on all trails. The rule is NON_COMPLIANT if the validation is not enabled.

Identifier: CLOUD_TRAIL_LOG_FILE_VALIDATION_ENABLED

Resource Types: AWS::CloudTrail::Trail

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cmk-backing-key-rotation-enabled

Checks if automatic key rotation is enabled for each key and matches to the key ID of the customer created AWS KMS key. The rule is NON_COMPLIANT if the AWS Config recorder role for a resource does not have the kms:DescribeKey permission.

> **Note**
>
> Automatic key rotation is not supported for asymmetric KMS keys, HMAC KMS keys, KMS keys with imported key material, or KMS keys in custom key stores.

Identifier: CMK_BACKING_KEY_ROTATION_ENABLED

Resource Types: AWS::KMS::Key

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

codeartifact-repository-tagged

Checks if AWS CodeArtifact repository resources have tags. Optionally, required tag keys can be specified. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: CODEARTIFACT_REPOSITORY_TAGGED

Resource Types: AWS::CodeArtifact::Repository

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Europe (London), Europe (Milan), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

codebuild-project-artifact-encryption

Checks if an AWS CodeBuild project has encryption enabled for all of its artifacts. The rule is NON_COMPLIANT if 'encryptionDisabled' is set to 'true' for any primary or secondary (if present) artifact configurations.

Identifier: CODEBUILD_PROJECT_ARTIFACT_ENCRYPTION

Resource Types: AWS::CodeBuild::Project

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

codebuild-project-environment-privileged-check

Checks if an AWS CodeBuild project environment has privileged mode enabled. The rule is NON_COMPLIANT for a CodeBuild project if 'privilegedMode' is set to 'true'.

Identifier: CODEBUILD_PROJECT_ENVIRONMENT_PRIVILEGED_CHECK

Resource Types: AWS::CodeBuild::Project

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

exemptedProjects (Optional), Type: CSV

> Comma-separated list of CodeBuild project names that are allowed to have 'privilegedMode' with value 'true'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

codebuild-project-envvar-awscred-check

Checks if the project contains environment variables AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY. The rule is NON_COMPLIANT when the project environment variables contains plaintext credentials.

Identifier: CODEBUILD_PROJECT_ENVVAR_AWSCRED_CHECK

Resource Types: AWS::CodeBuild::Project

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

codebuild-project-logging-enabled

Checks if an AWS CodeBuild project environment has at least one log option enabled. The rule is NON_COMPLIANT if the status of all present log configurations is set to 'DISABLED'.

Identifier: CODEBUILD_PROJECT_LOGGING_ENABLED

Resource Types: AWS::CodeBuild::Project

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

cloudWatchGroupNames (Optional), Type: String

Comma-separated list of Amazon CloudWatch log group names that logs should be be sent to if CloudWatch logs are configured.

s3BucketNames (Optional), Type: String

Comma-separated list of Amazon S3 bucket names that logs should be sent to if S3 logs are configured.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

codebuild-project-s3-logs-encrypted

Checks if a AWS CodeBuild project configured with Amazon S3 Logs has encryption enabled for its logs. The rule is NON_COMPLIANT if 'encryptionDisabled' is set to 'true' in a S3LogsConfig of a CodeBuild project.

Identifier: CODEBUILD_PROJECT_S3_LOGS_ENCRYPTED

Resource Types: AWS::CodeBuild::Project

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

exemptedProjects (Optional), Type: CSV

Comma-separated list of CodeBuild project names that are allowed to output unencrypted logs.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

codebuild-project-source-repo-url-check

Checks if the Bitbucket source repository URL contains sign-in credentials or not. The rule is NON_COMPLIANT if the URL contains any sign-in information and COMPLIANT if it doesn't.

Identifier: CODEBUILD_PROJECT_SOURCE_REPO_URL_CHECK

Resource Types: AWS::CodeBuild::Project

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

codebuild-project-tagged

Checks if AWS CodeBuild projects have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: CODEBUILD_PROJECT_TAGGED

Resource Types: AWS::CodeBuild::Project

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

codebuild-report-group-encrypted-at-rest

Checks if an AWS CodeBuild report group has encryption at rest setting enabled. The rule is NON_COMPLIANT if 'EncryptionDisabled' is 'true'.

Identifier: CODEBUILD_REPORT_GROUP_ENCRYPTED_AT_REST

Resource Types: AWS::CodeBuild::ReportGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

codebuild-report-group-tagged

Checks if AWS CodeBuild report groups have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: CODEBUILD_REPORT_GROUP_TAGGED

Resource Types: AWS::CodeBuild::ReportGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

codedeploy-auto-rollback-monitor-enabled

Checks if the deployment group is configured with automatic deployment rollback and deployment monitoring with alarms attached. The rule is NON_COMPLIANT if AutoRollbackConfiguration or AlarmConfiguration has not been configured or is not enabled.

Identifier: CODEDEPLOY_AUTO_ROLLBACK_MONITOR_ENABLED

Resource Types: AWS::CodeDeploy::DeploymentGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

codedeploy-deployment-group-auto-rollback-enabled

Checks if AWS CodeDeploy deployment groups have auto rollback configuration enabled. The rule is NON_COMPLIANT if configuration.autoRollbackConfiguration.enabled is false or does not exist.

Identifier: CODEDEPLOY_DEPLOYMENT_GROUP_AUTO_ROLLBACK_ENABLED

Resource Types: AWS::CodeDeploy::DeploymentGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

codedeploy-deployment-group-outdated-instances-update

Checks if AWS CodeDeploy deployment groups automatically update outdated instances. The rule is NON_COMPLIANT if configuration.outdatedInstancesStrategy is 'IGNORE'.

Identifier: CODEDEPLOY_DEPLOYMENT_GROUP_OUTDATED_INSTANCES_UPDATE

Resource Types: AWS::CodeDeploy::DeploymentGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

codedeploy-ec2-minimum-healthy-hosts-configured

Checks if the deployment group for EC2/On-Premises Compute Platform is configured with a minimum healthy hosts fleet percentage or host count greater than or equal to the input threshold. The rule is NON_COMPLIANT if either is below the threshold.

Identifier: CODEDEPLOY_EC2_MINIMUM_HEALTHY_HOSTS_CONFIGURED

Resource Types: AWS::CodeDeploy::DeploymentGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific

(Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

minimumHealthyHostsFleetPercent (Optional), Type: int, Default: 66

Minimum percentage of healthy hosts fleet during deployment. Default value is set to 66 percent.

minimumHealthyHostsHostCount (Optional), Type: int, Default: 1

Minimum number of healthy hosts in fleet during deployment. Default value is set to 1.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

codedeploy-lambda-allatonce-traffic-shift-disabled

Checks if the deployment group for Lambda Compute Platform is not using the default deployment configuration. The rule is NON_COMPLIANT if the deployment group is using the deployment configuration 'CodeDeployDefault.LambdaAllAtOnce'.

Identifier: CODEDEPLOY_LAMBDA_ALLATONCE_TRAFFIC_SHIFT_DISABLED

Resource Types: AWS::CodeDeploy::DeploymentGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

codeguruprofiler-profiling-group-tagged

Checks if Amazon CodeGuru Profiler profiling groups have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: CODEGURUPROFILER_PROFILING_GROUP_TAGGED

Resource Types: AWS::CodeGuruProfiler::ProfilingGroup

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

codegururreviewer-repository-association-tagged

Checks if Amazon CodeGuru Reviewer repository associations have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: CODEGURUREVIEWER_REPOSITORY_ASSOCIATION_TAGGED

Resource Types: AWS::CodeGuruReviewer::RepositoryAssociation

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

codepipeline-deployment-count-check

Checks if the first deployment stage of AWS CodePipeline performs more than one deployment. Optionally checks if each of the subsequent remaining stages deploy to more than the specified number of deployments (`deploymentLimit`).

Identifier: CODEPIPELINE_DEPLOYMENT_COUNT_CHECK

Resource Types: AWS::CodePipeline::Pipeline

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Middle East (Bahrain), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Asia Pacific (Osaka), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

deploymentLimit (Optional), Type: int

The maximum number of deployments each stage can perform.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

codepipeline-region-fanout-check

Checks if each stage in the AWS CodePipeline deploys to more than N times the number of the regions the AWS CodePipeline has deployed in all the previous combined stages, where N is the region fanout number. The first deployment stage can deploy to a maximum of one region and the second deployment stage can deploy to a maximum number specified in the `regionFanoutFactor`. If you do not provide a `regionFanoutFactor`, by default the value is three. For example: If 1st deployment stage deploys to one region and 2nd deployment stage deploys to three regions, 3rd deployment stage can deploy to 12 regions, that is, sum of previous stages multiplied by the region fanout (three) number. The rule is NON_COMPLIANT if the deployment is in more than one region in 1st stage or three regions in 2nd stage or 12 regions in 3rd stage.

Identifier: CODEPIPELINE_REGION_FANOUT_CHECK

Resource Types: AWS::CodePipeline::Pipeline

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Middle East (Bahrain), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Asia Pacific (Osaka), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

regionFanoutFactor (Optional), Type: int, Default: 3

The number of regions the AWS CodePipeline has deployed to in all previous stages is the acceptable number of regions any stage can deploy to.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cognito-identity-pool-unauthenticated-logins

Checks if Amazon Cognito identity pools disallow unauthenticated logins. The rule is NON_COMPLIANT if configuration.AllowUnauthenticatedIdentities is true.

Identifier: COGNITO_IDENTITY_POOL_UNAUTHENTICATED_LOGINS

Resource Types: AWS::Cognito::IdentityPool

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cognito-identity-pool-unauth-access-check

Checks if Amazon Cognito Identity Pool allows unauthenticated identities. The rule is NON_COMPLIANT if the Identity Pool is configured to allow unauthenticated identities.

Identifier: COGNITO_IDENTITY_POOL_UNAUTH_ACCESS_CHECK

Resource Types: AWS::Cognito::IdentityPool

Trigger type: Configuration changes

AWS Region: All supported AWS regions except AWS GovCloud (US-East), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cognito-userpool-cust-auth-threat-full-check

Checks if Amazon Cognito user pools have threat protection enabled with full-function enforcement mode for custom authentication. This rule is NON_COMPLIANT if threat protection for custom authentication is not set to full-function enforcement mode.

Identifier: COGNITO_USERPOOL_CUST_AUTH_THREAT_FULL_CHECK

Resource Types: AWS::Cognito::UserPool

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cognito-user-pool-advanced-security-enabled

Checks if an Amazon Cognito user pool has advanced security enabled for standard authentication. The rule is NON_COMPLIANT if advanced security is not enabled. Optionally, you can specify an advanced security mode for the rule to check.

Identifier: COGNITO_USER_POOL_ADVANCED_SECURITY_ENABLED

Resource Types: AWS::Cognito::UserPool

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

SecurityMode (Optional), Type: String

> String value of the advanced security mode for the rule to check. If provided, the rule is NON_COMPLIANT if the advanced security mode for user pools does not match this parameter value. Valid values are AUDIT and ENFORCED

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cognito-user-pool-deletion-protection-enabled

Checks whether Amazon Cognito user pools has deletion protection enabled. This rule is NON_COMPLIANT if a user pool has deletion protection disabled.

Identifier: COGNITO_USER_POOL_DELETION_PROTECTION_ENABLED

Resource Types: AWS::Cognito::UserPool

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cognito-user-pool-mfa-enabled

Checks if Amazon Cognito user pools configured with a PASSWORD-only sign-in policy have Multi-Factor Authentication (MFA) enabled. This rule is NON_COMPLIANT if the Cognito user pool configured with PASSWORD only sign in policy does not have MFA enabled.

Identifier: COGNITO_USER_POOL_MFA_ENABLED

Resource Types: AWS::Cognito::UserPool

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cognito-user-pool-password-policy-check

Checks if the password policy for Amazon cognito user pool meets the specified requirements indicated in the parameters. The rule is NON_COMPLIANT if the user pool password policy does not meet the specified requirements.

Identifier: COGNITO_USER_POOL_PASSWORD_POLICY_CHECK

Resource Types: AWS::Cognito::UserPool

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), China (Ningxia) Region

Parameters:

minLength (Optional), Type: int, Default: 8

Minimum length required for user pool password. Valid values are 6 to 99.

requireLowercase (Optional), Type: boolean, Default: True

Whether to require at least one lowercase letter in password.

requireNumbers (Optional), Type: boolean, Default: True

Whether to require at least one number in password.

requireSymbols (Optional), Type: boolean, Default: True

Whether to require at least one symbol in password.

requireUppercase (Optional), Type: boolean, Default: True

Whether to require at least one uppercase letter in password.

temporaryPasswordValidity (Optional), Type: int, Default: 7

Number of days a temporary password remains valid. Valid values are 1 to 365.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cognito-user-pool-tagged

Checks if Amazon Cognito user pools have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: COGNITO_USER_POOL_TAGGED

Resource Types: AWS::Cognito::UserPool

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

connect-instance-logging-enabled

Checks if Amazon Connect instances have flow logs enabled in an Amazon CloudWatch log group. The rule is NON_COMPLIANT if an Amazon Connect instance does not have flow logs enabled.

Identifier: CONNECT_INSTANCE_LOGGING_ENABLED

Resource Types: AWS::Connect::Instance

Trigger type: Configuration changes

AWS Region: Only available in Africa (Cape Town), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

customerprofiles-domain-tagged

Checks if Amazon Connect Customer Profiles domains have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: CUSTOMERPROFILES_DOMAIN_TAGGED

Resource Types: AWS::CustomerProfiles::Domain

Trigger type: Configuration changes

AWS Region: Only available in Africa (Cape Town), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

customerprofiles-object-type-allow-profile-creation

Checks if Amazon Connect Customer Profiles object types allow the creation of a new standard profile if one does not exist. The rule is NON_COMPLIANT if configuration.AllowProfileCreation is false.

Identifier: CUSTOMERPROFILES_OBJECT_TYPE_ALLOW_PROFILE_CREATION

Resource Types: AWS::CustomerProfiles::ObjectType

Trigger type: Configuration changes

AWS Region: Only available in Africa (Cape Town), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

customerprofiles-object-type-tagged

Checks if Amazon Connect Customer Profiles object types have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: CUSTOMERPROFILES_OBJECT_TYPE_TAGGED

Resource Types: AWS::CustomerProfiles::ObjectType

Trigger type: Configuration changes

AWS Region: Only available in Africa (Cape Town), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

custom-eventbus-policy-attached

Checks if Amazon EventBridge custom event buses have a resource-based policy attached. The rule is NON_COMPLIANT if a custom event bus policy does not have an attached resource-based policy.

Identifier: CUSTOM_EVENTBUS_POLICY_ATTACHED

Resource Types: AWS::Events::EventBus

Trigger type: Configuration changes

AWS Region: All supported AWS regions except AWS GovCloud (US-East), AWS GovCloud (US-West) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

custom-schema-registry-policy-attached

Checks if custom Amazon EventBridge schema registries have a resource policy attached. The rule is NON_COMPLIANT for custom schema registries without a resource policy attached.

Identifier: CUSTOM_SCHEMA_REGISTRY_POLICY_ATTACHED

Resource Types: AWS::EventSchemas::Registry

Trigger type: Periodic

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

cw-loggroup-retention-period-check

Checks if an Amazon CloudWatch LogGroup retention period is set to greater than 365 days or else a specified retention period. The rule is NON_COMPLIANT if the retention period is less than `MinRetentionTime`, if specified, or else 365 days.

> **Note**
>
> If the retention setting is "Never expire" for a log group, the rule is marked as COMPLIANT.

Identifier: CW_LOGGROUP_RETENTION_PERIOD_CHECK

Resource Types: AWS::Logs::LogGroup

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

LogGroupNames (Optional), Type: CSV

A comma-separated list of Log Group names to check the retention period.

MinRetentionTime (Optional), Type: int

Specify the retention time in days. Valid values are: 1, 3, 5, 7, 14, 30, 60, 90, 120, 150, 180, 365, 400, 545, 731, 1827, and 3653. The default retention period is 365 days.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

datasync-location-object-storage-using-https

Checks if AWS DataSync location object storage servers use the HTTPS protocol to communicate. The rule is NON_COMPLIANT if configuration.ServerProtocol is not 'HTTPS'.

Identifier: DATASYNC_LOCATION_OBJECT_STORAGE_USING_HTTPS

Resource Types: AWS::DataSync::LocationObjectStorage

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

datasync-task-data-verification-enabled

Checks if AWS DataSync tasks have data verification enabled to perform additional verification at the end of your transfer. The rule is NON_COMPLIANT if configuration.Options.VerifyMode is 'NONE'.

Identifier: DATASYNC_TASK_DATA_VERIFICATION_ENABLED

Resource Types: AWS::DataSync::Task

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

datasync-task-logging-enabled

Checks if an AWS DataSync task has Amazon CloudWatch logging enabled. The rule is NON_COMPLIANT if an AWS DataSync task does not have Amazon CloudWatch logging enabled or if the logging level is not equivalent to the logging level that you specify.

Identifier: DATASYNC_TASK_LOGGING_ENABLED

Resource Types: AWS::DataSync::Task

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Mexico (Central), Canada West (Calgary) Region

Parameters:

logLevel (Optional), Type: String

> String value for the logging level. Valid values include: 'BASIC' and 'TRANSFER'. If not specified, the default value is 'BASIC'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

datasync-task-tagged

Checks if AWS DataSync tasks have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: DATASYNC_TASK_TAGGED

Resource Types: AWS::DataSync::Task

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dax-encryption-enabled

Checks if Amazon DynamoDB Accelerator (DAX) clusters are encrypted. The rule is NON_COMPLIANT if a DAX cluster is not encrypted.

Identifier: DAX_ENCRYPTION_ENABLED

Resource Types: AWS::DAX::Cluster

Trigger type: Periodic

AWS Region: Only available in Europe (Stockholm), China (Beijing), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Europe (Spain), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dax-tls-endpoint-encryption

Checks if your Amazon DynamoDB Accelerator (DAX) cluster has ClusterEndpointEncryptionType set to TLS. The rule is NON_COMPLIANT if a DAX cluster is not encrypted by transport layer security (TLS).

Identifier: DAX_TLS_ENDPOINT_ENCRYPTION

Resource Types: AWS::DAX::Cluster

Trigger type: Periodic

AWS Region: Only available in Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Asia Pacific (Malaysia), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

db-instance-backup-enabled

Checks if RDS DB instances have backups enabled. Optionally, the rule checks the backup retention period and the backup window.

Identifier: DB_INSTANCE_BACKUP_ENABLED

Resource Types: AWS::RDS::DBInstance

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

backupRetentionMinimum (Optional), Type: int

Minimum retention period for backups.

backupRetentionPeriod (Optional), Type: int

Retention period for backups.

checkReadReplicas (Optional), Type: boolean

Checks whether RDS DB instances have backups enabled for read replicas.

preferredBackupWindow (Optional), Type: String

Time range in which backups are created.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

desired-instance-tenancy

Checks EC2 instances for a 'tenancy' value. Also checks if AMI IDs are specified to be launched from those AMIs or if Host IDs are launched on those Dedicated Hosts. The rule is COMPLIANT if the instance matches a host and an AMI, if specified, in a list.

Identifier: DESIRED_INSTANCE_TENANCY

Resource Types: AWS::EC2::Instance

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

tenancy, Type: String

Desired tenancy of the instances. Valid values are DEDICATED, HOST and DEFAULT

hostId (Optional), Type: CSV

The IDs of the EC2 Dedicated Hosts on which the instances are meant to be launched. Separate multiple Host IDs with commas

imageId (Optional), Type: CSV

The rule evaluates instances launched only from AMIs with the specified IDs. Separate multiple AMI IDs with commas

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

desired-instance-type

Checks if your EC2 instances are of a specific instance type. The rule is NON_COMPLIANT if an EC2 instance is not specified in the parameter list. For a list of supported EC2 instance types, see Instance types in the EC2 User Guide for Linux Instances.

Identifier: DESIRED_INSTANCE_TYPE

Resource Types: AWS::EC2::Instance

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

instanceType, Type: CSV

Comma-separated list of EC2 instance types (for example, "t2.small, m4.large, i2.xlarge").

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

devicefarm-instance-profile-tagged

Checks if AWS Device Farm instance profiles have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: DEVICEFARM_INSTANCE_PROFILE_TAGGED

Resource Types: AWS::DeviceFarm::InstanceProfile

Trigger type: Configuration changes

AWS Region: Only available in US West (Oregon) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

devicefarm-project-tagged

Checks if AWS Device Farm projects have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: DEVICEFARM_PROJECT_TAGGED

Resource Types: AWS::DeviceFarm::Project

Trigger type: Configuration changes

AWS Region: Only available in US West (Oregon) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

devicefarm-test-grid-project-tagged

Checks if AWS Device Farm test grid projects have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: DEVICEFARM_TEST_GRID_PROJECT_TAGGED

Resource Types: AWS::DeviceFarm::TestGridProject

Trigger type: Configuration changes

AWS Region: Only available in US West (Oregon) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dms-auto-minor-version-upgrade-check

Checks if an AWS Database Migration Service (AWS DMS) replication instance has automatic minor version upgrades enabled. The rule is NON_COMPLIANT if an AWS DMS replication instance is not configured with automatic minor version upgrades.

Identifier: DMS_AUTO_MINOR_VERSION_UPGRADE_CHECK

Resource Types: AWS::DMS::ReplicationInstance

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Mexico (Central), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dms-endpoint-ssl-configured

Checks if AWS Database Migration Service (AWS DMS) endpoints are configured with an SSL connection. The rule is NON_COMPLIANT if AWS DMS does not have an SSL connection configured.

Context: SSL/TLS connections provide one layer of security by encrypting data that moves between your client and a DB instance. Using server certificate provides an extra layer of security by validating that the connection is being made to an Amazon RDS DB instance. It does so by checking the server certificate that is automatically installed on all DB instances that you provision. By enabling SSL connection on AWS DMS, you protect the confidentiality of the data during the migration.

To configure SSL connection for AWS DMS, see Using SSL/TLS to encrypt a connection to a DB instance or cluster in the *Amazon Relational Database Service User Guide*.

Identifier: DMS_ENDPOINT_SSL_CONFIGURED

Resource Types: AWS::DMS::Endpoint

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dms-endpoint-tagged

Checks if AWS DMS endpoints have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: DMS_ENDPOINT_TAGGED

Resource Types: AWS::DMS::Endpoint

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dms-mongo-db-authentication-enabled

Checks if AWS Database Migration Service (AWS DMS) endpoints for MongoDb data stores are enabled for password-based authentication and access control. The rule is NON_COMPLIANT if password-based authentication and access control is not enabled.

Identifier: DMS_MONGO_DB_AUTHENTICATION_ENABLED

Resource Types: AWS::DMS::Endpoint

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Mexico (Central), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dms-neptune-iam-authorization-enabled

Checks if an AWS Database Migration Service (AWS DMS) endpoint for Amazon Neptune databases is configured with IAM authorization. The rule is NON_COMPLIANT if an AWS DMS endpoint where Neptune is the target has IamAuthEnabled set to false.

Identifier: DMS_NEPTUNE_IAM_AUTHORIZATION_ENABLED

Resource Types: AWS::DMS::Endpoint

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Europe (Milan), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dms-redis-tls-enabled

Checks if AWS Database Migration Service (AWS DMS) endpoints for Redis data stores are enabled for TLS/SSL encryption of data communicated with other endpoints. The rule is NON_COMPLIANT if TLS/SSL encryption is not enabled.

Identifier: DMS_REDIS_TLS_ENABLED

Resource Types: AWS::DMS::Endpoint

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dms-replication-instance-multi-az-enabled

Checks if AWS Database Migration Service (DMS) replication instances are configured with multiple Availability Zones. The rule is NON_COMPLIANT if a DMS replication instance is not configured to use multiple Availability Zones.

Identifier: DMS_REPLICATION_INSTANCE_MULTI_AZ_ENABLED

Resource Types: AWS::DMS::ReplicationInstance

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Mexico (Central), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dms-replication-not-public

Checks if AWS Database Migration Service (AWS DMS) replication instances are public. The rule is NON_COMPLIANT if PubliclyAccessible field is set to true.

Identifier: DMS_REPLICATION_NOT_PUBLIC

Resource Types: AWS::DMS::ReplicationInstance

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dms-replication-task-sourcedb-logging

Checks if logging is enabled with a valid severity level for AWS DMS replication tasks of a source database. The rule is NON_COMPLIANT if logging is not enabled or logs for DMS replication tasks of a source database have a severity level that is not valid.

Identifier: DMS_REPLICATION_TASK_SOURCEDB_LOGGING

Resource Types: AWS::DMS::ReplicationTask

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dms-replication-task-tagged

Checks if AWS DMS replication tasks have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: DMS_REPLICATION_TASK_TAGGED

Resource Types: AWS::DMS::ReplicationTask

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dms-replication-task-targetdb-logging

Checks if logging is enabled with a valid severity level for AWS DMS replication task events of a target database. The rule is NON_COMPLIANT if logging is not enabled or replication task logging of a target database has a severity level that is not valid.

Identifier: DMS_REPLICATION_TASK_TARGETDB_LOGGING

Resource Types: AWS::DMS::ReplicationTask

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

docdb-cluster-audit-logging-enabled

Checks if an Amazon DocumentDB (with MongoDB compatibility) instance cluster has CloudWatch log export enabled for audit logs. The rule is NON_COMPLIANT if an Amazon DocumentDB instance cluster does not have CloudWatch log export enabled for audit logs.

Identifier: DOCDB_CLUSTER_AUDIT_LOGGING_ENABLED

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Europe (Stockholm), Middle East (Bahrain), China (Beijing), Africa (Cape Town), Asia Pacific (Osaka), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), US West (N. California), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

docdb-cluster-backup-retention-check

Checks if an Amazon Document DB cluster retention period is set to specific number of days. The rule is NON_COMPLIANT if the retention period is less than the value specified by the parameter.

Identifier: DOCDB_CLUSTER_BACKUP_RETENTION_CHECK

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Europe (Stockholm), Middle East (Bahrain), China (Beijing), Africa (Cape Town), Asia Pacific (Osaka), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), US West (N. California), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

minimumBackupRetentionPeriod (Optional), Type: int

Minimum days backups should be kept. Valid values 1 to 35, default value is 7. This rule is NON_COMPLIANT if value is greater than 'backupRetentionPeriod'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

docdb-cluster-deletion-protection-enabled

Checks if an Amazon DocumentDB (with MongoDB compatibility) cluster has deletion protection enabled. The rule is NON_COMPLIANT if an Amazon DocumentDB cluster has the deletionProtection field set to false.

Identifier: DOCDB_CLUSTER_DELETION_PROTECTION_ENABLED

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Europe (Stockholm), Middle East (Bahrain), China (Beijing), Africa (Cape Town), Asia Pacific (Osaka), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), US West (N. California), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

docdb-cluster-encrypted

Checks if storage encryption is enabled for your Amazon DocumentDB (with MongoDB compatibility) clusters. The rule is NON_COMPLIANT if storage encryption is not enabled.

Identifier: DOCDB_CLUSTER_ENCRYPTED

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Europe (Stockholm), Middle East (Bahrain), China (Beijing), Africa (Cape Town), Asia Pacific (Osaka), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), US West (N. California), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

kmsKeyArns (Optional), Type: CSV

A comma-separated list of KMS key ARNs to compare with the KmsKeyID of the encrypted cluster.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

docdb-cluster-encrypted-in-transit

Checks if connections to Amazon DocumentDB clusters are configured to use encryption in transit. The rule is NON_COMPLIANT if the parameter group is not "in-sync", or the TLS parameter is set to either "disabled" or a value in `excludeTlsParameters`.

Identifier: DOCDB_CLUSTER_ENCRYPTED_IN_TRANSIT

Resource Types: AWS::RDS::DBCluster

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Europe (Stockholm), Middle East (Bahrain), Africa (Cape Town), Asia Pacific (Osaka), Asia Pacific (Melbourne), US West (N. California), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

excludeTlsParameters (Optional), Type: CSV

Comma-separated list of TLS cluster parameters for the rule to NOT check. Default value: 'disabled'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

docdb-cluster-snapshot-public-prohibited

Checks if Amazon DocumentDB manual cluster snapshots are public. The rule is NON_COMPLIANT if any Amazon DocumentDB manual cluster snapshots are public.

Identifier: DOCDB_CLUSTER_SNAPSHOT_PUBLIC_PROHIBITED

Resource Types: AWS::RDS::DBClusterSnapshot

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Europe (Stockholm), Middle East (Bahrain), China (Beijing), Africa (Cape Town), Asia Pacific (Osaka), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), US West (N. California), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dsql-cluster-deletion-protection-enabled

Checks if an Amazon Aurora DSQL cluster has deletion protection enabled. The rule is NON_COMPLIANT if configuration.DeletionProtectionEnabled is false.

Identifier: DSQL_CLUSTER_DELETION_PROTECTION_ENABLED

Resource Types: AWS::DSQL::Cluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Middle East (Bahrain), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Europe (Milan), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), US West (N. California), Israel (Tel Aviv), Asia Pacific (Taipei), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dsql-cluster-multi-region-replication-enabled

Checks if an Amazon Aurora DSQL cluster is replicated to another AWS Region through multi-Region peering. The rule is NON_COMPLIANT if configuration.MultiRegionProperties.Clusters does not exist, is empty, or the cluster status is not ACTIVE.

Identifier: DSQL_CLUSTER_MULTI_REGION_REPLICATION_ENABLED

Resource Types: AWS::DSQL::Cluster

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Osaka), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Canada (Central), Canada West (Calgary), Europe (Spain) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dsql-cluster-tagged

Checks if Amazon Aurora DSQL clusters have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: DSQL_CLUSTER_TAGGED

Resource Types: AWS::DSQL::Cluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Middle East (Bahrain), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Europe (Milan), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), US West (N. California), Israel (Tel Aviv), Asia Pacific (Taipei), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dynamodb-autoscaling-enabled

Checks if Amazon DynamoDB tables or global secondary indexes can process read/write capacity using on-demand mode or provisioned mode with auto scaling enabled. The rule is NON_COMPLIANT if either mode is used without auto scaling enabled

Identifier: DYNAMODB_AUTOSCALING_ENABLED

Resource Types: AWS::DynamoDB::Table

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

maxProvisionedReadCapacity (Optional), Type: int

The maximum number of units that should be provisioned with read capacity in the Auto Scaling group.

maxProvisionedWriteCapacity (Optional), Type: int

The maximum number of units that should be provisioned with write capacity in the Auto Scaling group.

minProvisionedReadCapacity (Optional), Type: int

The minimum number of units that should be provisioned with read capacity in the Auto Scaling group.

minProvisionedWriteCapacity (Optional), Type: int

The minimum number of units that should be provisioned with write capacity in the Auto Scaling group.

targetReadUtilization (Optional), Type: double

The target utilization percentage for read capacity. Target utilization is expressed in terms of the ratio of consumed capacity to provisioned capacity.

targetWriteUtilization (Optional), Type: double

The target utilization percentage for write capacity. Target utilization is expressed in terms of the ratio of consumed capacity to provisioned capacity.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dynamodb-in-backup-plan

Checks if an Amazon DynamoDB table is present in AWS Backup plans. The rule is NON_COMPLIANT if DynamoDB tables are not present in any AWS Backup plan.

Identifier: DYNAMODB_IN_BACKUP_PLAN

Resource Types: AWS::DynamoDB::Table

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dynamodb-last-backup-recovery-point-created

Checks if a recovery point was created for Amazon DynamoDB Tables within the specified period. The rule is NON_COMPLIANT if the DynamoDB Table does not have a corresponding recovery point created within the specified time period.

Identifier: DYNAMODB_LAST_BACKUP_RECOVERY_POINT_CREATED

Resource Types: AWS::DynamoDB::Table

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

recoveryPointAgeUnit (Optional), Type: String, Default: days

Unit of time for maximum allowed age. Accepted values: 'hours', 'days'.

recoveryPointAgeValue (Optional), Type: int, Default: 1

Numerical value for maximum allowed age. No more than 744 for hours, 31 for days.

resourceId (Optional), Type: String

Name of DynamoDB Table for the rule to check.

resourceTags (Optional), Type: String

Tags of the DynamoDB Tables for the rule to check, in JSON format `{"tagkey" : "tagValue"}`.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dynamodb-meets-restore-time-target

Checks if the restore time of Amazon DynamoDB Tables meets the specified duration. The rule is NON_COMPLIANT if LatestRestoreExecutionTimeMinutes of a DynamoDB Table is greater than maxRestoreTime minutes.

Identifier: DYNAMODB_MEETS_RESTORE_TIME_TARGET

Resource Types: AWS::DynamoDB::Table

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

maxRestoreTime, Type: int

Numerical value for the maximum allowed restore runtime.

resourceId (Optional), Type: String

Name of DynamoDB Table for the rule to check.

resourceTags (Optional), Type: String

Tags of the DynamoDB Tables for the rule to check, in JSON format.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dynamodb-pitr-enabled

Checks if point-in-time recovery (PITR) is enabled for Amazon DynamoDB tables. The rule is NON_COMPLIANT if PITR is not enabled for DynamoDB tables.

Identifier: DYNAMODB_PITR_ENABLED

Resource Types: AWS::DynamoDB::Table

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dynamodb-resources-protected-by-backup-plan

Checks if Amazon DynamoDB tables are protected by a backup plan. The rule is NON_COMPLIANT if the DynamoDB Table is not covered by a backup plan.

Identifier: DYNAMODB_RESOURCES_PROTECTED_BY_BACKUP_PLAN

Resource Types: AWS::DynamoDB::Table

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

backupVaultLockCheck (Optional), Type: String

Accepted values: 'True' or 'False'. Enter 'True' for the rule to check if the resource is backed up in a locked vault

crossAccountList (Optional), Type: String

Comma-separated list of destination accounts for cross-account backup copy to be kept

crossRegionList (Optional), Type: String

Comma-separated list of destination regions for the cross-region backup copy to be kept

maxRetentionDays (Optional), Type: int

The maximum retention period in days for the Backup Vault Lock

minRetentionDays (Optional), Type: int

The minimum retention period in days for the Backup Vault Lock

resourceId (Optional), Type: String

Name of DynamoDB table for the rule to check.

resourceTags (Optional), Type: String

Tags for DynamoDB tables for the rule to check, in JSON format `{"tagkey" : "tagValue"}`.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dynamodb-table-cross-region-replication-enabled

Checks if an Amazon DynamoDB table has an active cross-Region replica through global tables. The rule is NON_COMPLIANT if configuration.replicas is empty or if no replica has a regionName other than the table's awsRegion and replicaStatus ACTIVE.

Identifier: DYNAMODB_TABLE_CROSS_REGION_REPLICATION_ENABLED

Resource Types: AWS::DynamoDB::Table

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Middle East (Bahrain), Middle East (UAE), AWS GovCloud (US-East), AWS GovCloud (US-West) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dynamodb-table-deletion-protection-enabled

Checks if an Amazon DynamoDB table have deletion protection set to enabled. The rule is NON_COMPLIANT if the table have deletion protection set to disabled.

Identifier: DYNAMODB_TABLE_DELETION_PROTECTION_ENABLED

Resource Types: AWS::DynamoDB::Table

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dynamodb-table-encrypted-kms

Checks if Amazon DynamoDB table is encrypted with AWS Key Management Service (KMS). The rule is NON_COMPLIANT if Amazon DynamoDB table is not encrypted with AWS KMS. The rule is also NON_COMPLIANT if the encrypted AWS KMS key is not present in `kmsKeyArns` input parameter.

Identifier: DYNAMODB_TABLE_ENCRYPTED_KMS

Resource Types: AWS::DynamoDB::Table

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

kmsKeyArns (Optional), Type: CSV

Comma separated list of AWS KMS key ARNs allowed for encrypting Amazon DynamoDB Tables

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dynamodb-table-encryption-enabled

Checks if the Amazon DynamoDB tables are encrypted and checks their status. The rule is COMPLIANT if the status is enabled or enabling.

Identifier: DYNAMODB_TABLE_ENCRYPTION_ENABLED

Resource Types: AWS::DynamoDB::Table

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

dynamodb-throughput-limit-check

Checks if provisioned DynamoDB throughput is approaching the maximum limit for your account. By default, the rule checks if provisioned throughput exceeds a threshold of 80 percent of your account limits.

Identifier: DYNAMODB_THROUGHPUT_LIMIT_CHECK

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

accountRCUThresholdPercentage (Optional), Type: int, Default: 80

> Percentage of provisioned read capacity units for your account. When this value is reached, the rule is marked as noncompliant.

accountWCUThresholdPercentage (Optional), Type: int, Default: 80

Percentage of provisioned write capacity units for your account. When this value is reached, the rule is marked as noncompliant.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ebs-in-backup-plan

Check if Amazon Elastic Block Store (Amazon EBS) volumes are added in backup plans of AWS Backup. The rule is NON_COMPLIANT if Amazon EBS volumes are not included in backup plans.

Identifier: EBS_IN_BACKUP_PLAN

Resource Types: AWS::EC2::Volume

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ebs-last-backup-recovery-point-created

Checks if a recovery point was created for Amazon Elastic Block Store (Amazon EBS). The rule is NON_COMPLIANT if the Amazon EBS volume does not have a corresponding recovery point created within the specified time period.

Identifier: EBS_LAST_BACKUP_RECOVERY_POINT_CREATED

Resource Types: AWS::EC2::Volume

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

recoveryPointAgeUnit (Optional), Type: String, Default: days

Unit of time for maximum allowed age. Accepted values: 'hours', 'days'.

recoveryPointAgeValue (Optional), Type: int, Default: 1

Numerical value for maximum allowed age. No more than 744 for hours, 31 for days.

resourceId (Optional), Type: String

ID of Amazon EBS volume for the rule to check.

resourceTags (Optional), Type: String

Tags of Amazon EBS volumes for the rule to check, in JSON format `{"tagkey" : "tagValue"}`.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ebs-meets-restore-time-target

Checks if the restore time of Amazon Elastic Block Store (Amazon EBS) volumes meets the specified duration. The rule is NON_COMPLIANT if LatestRestoreExecutionTimeMinutes of an Amazon EBS volume is greater than maxRestoreTime minutes.

Identifier: EBS_MEETS_RESTORE_TIME_TARGET

Resource Types: AWS::EC2::Volume

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

maxRestoreTime, Type: int

Numerical value for the maximum allowed restore runtime.

resourceId (Optional), Type: String

ID of Amazon EBS volume for the rule to check.

resourceTags (Optional), Type: String

Tags for Amazon EBS volumes for the rule to check, in JSON format.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ebs-optimized-instance

Checks if Amazon EBS optimization is enabled for your Amazon Elastic Compute Cloud (Amazon EC2) instances that can be Amazon EBS-optimized. The rule is NON_COMPLIANT if EBS optimization is not enabled for an Amazon EC2 instance that can be EBS-optimized.

> **Note**
>
> EC2 instances which are EBS-optimized by default always result in rule evaluations returning `COMPLIANT`.

Identifier: EBS_OPTIMIZED_INSTANCE

Resource Types: AWS::EC2::Instance

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ebs-resources-in-logically-air-gapped-vault

Checks if Amazon Elastic Block Store (Amazon EBS) volumes are in a logically air-gapped vault. The rule is NON_COMPLIANT if an Amazon EBS volume is not in a logically air-gapped vault within the specified time period.

Identifier: EBS_RESOURCES_IN_LOGICALLY_AIR_GAPPED_VAULT

Resource Types: AWS::EC2::Volume

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

recoveryPointAgeUnit (Optional), Type: String, Default: days

Unit of time for maximum allowed age. Accepted values: 'hours', 'days'.

recoveryPointAgeValue (Optional), Type: int, Default: 1

Numerical value for maximum allowed age. No more than 2184 for hours, 91 for days.

resourceId (Optional), Type: String

ID of Amazon EBS volume for the rule to check.

resourceTags (Optional), Type: String

Tags of Amazon EBS volumes for the rule to check, in JSON format.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ebs-resources-protected-by-backup-plan

Checks if Amazon Elastic Block Store (Amazon EBS) volumes are protected by a backup plan. The rule is NON_COMPLIANT if the Amazon EBS volume is not covered by a backup plan.

Identifier: EBS_RESOURCES_PROTECTED_BY_BACKUP_PLAN

Resource Types: AWS::EC2::Volume

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

backupVaultLockCheck (Optional), Type: String

Accepted values: 'True' or 'False'. Enter 'True' for the rule to check if the resource is backed up in a locked vault

crossAccountList (Optional), Type: String

Comma-separated list of destination accounts for cross-account backup copy to be kept

crossRegionList (Optional), Type: String

Comma-separated list of destination regions for the cross-region backup copy to be kept

maxRetentionDays (Optional), Type: int

The maximum retention period in days for the Backup Vault Lock

minRetentionDays (Optional), Type: int

The minimum retention period in days for the Backup Vault Lock

resourceId (Optional), Type: String

ID of Amazon EBS volume for the rule to check.

resourceTags (Optional), Type: String

Tags for Amazon EBS volumes for the rule to check, in JSON format `{"tagkey" : "tagValue"}`.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ebs-snapshot-block-public-access

Checks if block public access is enabled for Amazon EBS snapshots in an AWS Region. The rule is NON_COMPLIANT if block public access is not enabled for all public sharing of EBS snapshots in an AWS Region.

Identifier: EBS_SNAPSHOT_BLOCK_PUBLIC_ACCESS

Resource Types: AWS::EC2::SnapshotBlockPublicAccess

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Mexico (Central), Asia Pacific (Taipei) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ebs-snapshot-public-restorable-check

Checks if Amazon Elastic Block Store (Amazon EBS) snapshots are not publicly restorable. The rule is NON_COMPLIANT if one or more snapshots with RestorableByUserIds field are set to all, that is, Amazon EBS snapshots are public.

Identifier: EBS_SNAPSHOT_PUBLIC_RESTORABLE_CHECK

Trigger type: Periodic

AWS Region: All supported AWS regions except Europe (Spain) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-capacity-reservation-tagged

Checks if Amazon EC2 capacity reservations have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EC2_CAPACITY_RESERVATION_TAGGED

Resource Types: AWS::EC2::CapacityReservation

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-carrier-gateway-tagged

Checks if Amazon EC2 carrier gateways have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EC2_CARRIER_GATEWAY_TAGGED

Resource Types: AWS::EC2::CarrierGateway

Trigger type: Configuration changes

AWS Region: Only available in Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-client-vpn-connection-log-enabled

Checks if AWS Client VPN endpoint has client connection logging enabled. The rule is NON_COMPLIANT if 'Configuration.ConnectionLogOptions.Enabled' is set to false.

Identifier: EC2_CLIENT_VPN_CONNECTION_LOG_ENABLED

Resource Types: AWS::EC2::ClientVpnEndpoint

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing), Middle East (UAE), Asia Pacific (Hyderabad), Mexico (Central), Canada West (Calgary), Europe (Spain), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-client-vpn-endpoint-tagged

Checks if Amazon EC2 client VPN endpoints have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EC2_CLIENT_VPN_ENDPOINT_TAGGED

Resource Types: AWS::EC2::ClientVpnEndpoint

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-client-vpn-not-authorize-all

Checks if the AWS Client VPN authorization rules authorizes connection access for all clients. The rule is NON_COMPLIANT if 'AccessAll' is present and set to true.

Identifier: EC2_CLIENT_VPN_NOT_AUTHORIZE_ALL

Resource Types: AWS::EC2::ClientVpnEndpoint

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-dhcp-options-tagged

Checks if Amazon EC2 DHCP options have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EC2_DHCP_OPTIONS_TAGGED

Resource Types: AWS::EC2::DHCPOptions

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-ebs-encryption-by-default

Checks if Amazon Elastic Block Store (EBS) encryption is enabled by default. The rule is NON_COMPLIANT if the encryption is not enabled.

Identifier: EC2_EBS_ENCRYPTION_BY_DEFAULT

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-enis-source-destination-check-enabled

Checks if EC2 ENIs managed by users have source/destination check enabled. The rule is NON_COMPLIANT if source/destination check is disabled on these ENIs for 'lambda', 'aws_codestar_connections_managed', 'branch', 'efa', 'interface', and 'quicksight'.

Identifier: EC2_ENIS_SOURCE_DESTINATION_CHECK_ENABLED

Resource Types: AWS::EC2::NetworkInterface

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-fleet-tagged

Checks if Amazon EC2 fleets have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EC2_FLEET_TAGGED

Resource Types: AWS::EC2::EC2Fleet

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-imdsv2-check

Checks whether your Amazon Elastic Compute Cloud (Amazon EC2) instance metadata version is configured with Instance Metadata Service Version 2 (IMDSv2). The rule is NON_COMPLIANT if the HttpTokens is set to optional.

Identifier: EC2_IMDSV2_CHECK

Resource Types: AWS::EC2::Instance

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-instance-detailed-monitoring-enabled

Checks if detailed monitoring is enabled for EC2 instances. The rule is NON_COMPLIANT if detailed monitoring is not enabled.

Identifier: EC2_INSTANCE_DETAILED_MONITORING_ENABLED

Resource Types: AWS::EC2::Instance

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-instance-launched-with-allowed-ami

Checks if running or stopped EC2 instances were launched with Amazon Machine Images (AMIs) that meet your Allowed AMIs criteria. The rule is NON_COMPLIANT if an AMI doesn't meet the Allowed AMIs criteria and the Allowed AMIs settings isn't disabled.

Identifier: EC2_INSTANCE_LAUNCHED_WITH_ALLOWED_AMI

Resource Types: AWS::EC2::Instance

Trigger type: Configuration changes and Periodic

AWS Region: All supported AWS regions

Parameters:

InstanceStateNameList (Optional), Type: CSV

Comma-separate list of Amazon EC2 instance states for the rule to check. Valid values are "running" and "stopped".

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-instance-managed-by-systems-manager

> **Important**
>
> For this rule, the rule identifier (EC2_INSTANCE_MANAGED_BY_SSM) and rule name (ec2-instance-managed-by-systems-manager) are different.

Checks if your Amazon EC2 instances are managed by AWS Systems Manager Agent (SSM Agent). The rule is NON_COMPLIANT if an EC2 instance is running and the SSM Agent is stopped, or if an EC2 instance is running and the SSM Agent is terminated.

> **Note**
>
> The rule will not return NON_COMPLIANT if an EC2 instance is stopped and the SSM Agent is running.

Identifier: EC2_INSTANCE_MANAGED_BY_SSM

Resource Types: AWS::EC2::Instance, AWS::SSM::ManagedInstanceInventory

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-instance-multiple-eni-check

Checks if Amazon Elastic Compute Cloud (Amazon EC2) uses multiple Elastic Network Interfaces (ENIs) or Elastic Fabric Adapters (EFAs). The rule is NON_COMPLIANT an Amazon EC2 instance use multiple network interfaces.

Identifier: EC2_INSTANCE_MULTIPLE_ENI_CHECK

Resource Types: AWS::EC2::Instance

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

NetworkInterfaceIds (Optional), Type: CSV

Comma-separated list of network instance IDs

Proactive Evaluation

For steps on how to run this rule in proactive mode, see Evaluating Your Resources with AWS Config Rules. For this rule to return COMPLIANT in proactive mode, the resource configuration schema for the StartResourceEvaluation API needs to include the following inputs, encoded as a string:

```
"ResourceConfiguration":
...
{
```

```
  "NetworkInterfaces": "[NetworkInterfaceId-1, NetworkInterfaceId-2,
 NetworkInterfaceId-3, ...]"
}
...
```

For more information on proactive evaluation, see Evaluation Mode.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-instance-no-public-ip

Checks whether Amazon Elastic Compute Cloud (Amazon EC2) instances have a public IP association. The rule is NON_COMPLIANT if the publicIp field is present in the Amazon EC2 instance configuration item. This rule applies only to IPv4.

Context: Public IP addresses can make EC2 instances directly accessible from the internet, which might not always be desirable from a security or compliance standpoint:

- **Security**: In many cases, you might not want your EC2 instances to have public IP addresses unless they need to be publicly accessible. Having a public IP address can expose your EC2 instance to potential security risks, such as unauthorized access or attacks.
- **Compliance**: Various compliance standards such as PCI, DSS, or HIPAA have specific requirements regarding network segmentation and access controls. Ensuring that EC2 instances do not have unnecessary public IP addresses can help ensure compliance with these requirements.
- **Cost Management**: Public IP addresses can incur additional costs, especially if there are EC2 instances continuously associated with them. By identifying EC2 instances with public IPs which do not need them, you can potentially reduce costs.

Identifier: EC2_INSTANCE_NO_PUBLIC_IP

Resource Types: AWS::EC2::Instance

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-instance-profile-attached

Checks if an EC2 instance has an AWS Identity and Access Management (IAM) profile attached to it. The rule is NON_COMPLIANT if no IAM profile is attached to the EC2 instance.

Identifier: EC2_INSTANCE_PROFILE_ATTACHED

Resource Types: AWS::EC2::Instance

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

IamInstanceProfileArnList (Optional), Type: CSV

Comma-separated list of IAM profile Amazon Resource Names (ARNs) that can be attached to Amazon EC2 instances.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-ipamscope-tagged

Checks if Amazon EC2 IPAM Scopes have tags. Optionally, required tag keys can be specified. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EC2_IPAMSCOPE_TAGGED

Resource Types: AWS::EC2::IPAMScope

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-last-backup-recovery-point-created

Checks if a recovery point was created for Amazon Elastic Compute Cloud (Amazon EC2) instances. The rule is NON_COMPLIANT if the Amazon EC2 instance does not have a corresponding recovery point created within the specified time period.

Identifier: EC2_LAST_BACKUP_RECOVERY_POINT_CREATED

Resource Types: AWS::EC2::Instance

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

recoveryPointAgeUnit (Optional), Type: String, Default: days

Unit of time for maximum allowed age. Accepted values: 'hours', 'days'.

recoveryPointAgeValue (Optional), Type: int, Default: 1

Numerical value for maximum allowed age. No more than 744 for hours, 31 for days.

resourceId (Optional), Type: String

ID of Amazon EC2 instance for the rule to check.

resourceTags (Optional), Type: String

Tags of Amazon EC2 instances for the rule to check, in JSON format `{"tagkey" : "tagValue"}`.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-launchtemplate-ebs-encrypted

Checks if Amazon EC2 launch template resources have encrypted EBS volumes. The rule is NON_COMPLIANT if any EBS volumes are not encrypted. The rule will only check the default version of the LaunchTemplate.

Identifier: EC2_LAUNCHTEMPLATE_EBS_ENCRYPTED

Resource Types: AWS::EC2::LaunchTemplate

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-launch-templates-ebs-volume-encrypted

Checks whether Amazon EC2 launch templates have encryption enabled for all attached EBS volumes.The rule is NON_COMPLIANT if encryption is set to False for any EBS volume configured in the launch template.

Identifier: EC2_LAUNCH_TEMPLATES_EBS_VOLUME_ENCRYPTED

Resource Types: AWS::EC2::LaunchTemplate

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Mexico (Central), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-launch-template-imdsv2-check

Checks if the currently set default version of an Amazon EC2 Launch Template requires new launched instances to use V2 of the Amazon EC2 Instance Metadata Service (IMDSv2). The rule is NON_COMPLIANT if 'Metadata version' is not specified as V2 (IMDSv2).

Identifier: EC2_LAUNCH_TEMPLATE_IMDSV2_CHECK

Resource Types: AWS::EC2::LaunchTemplate

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-launch-template-public-ip-disabled

Checks if Amazon EC2 Launch Templates are set to assign public IP addresses to Network Interfaces. The rule is NON_COMPLIANT if the default version of an EC2 Launch Template has at least 1 Network Interface with 'AssociatePublicIpAddress' set to 'true'.

Identifier: EC2_LAUNCH_TEMPLATE_PUBLIC_IP_DISABLED

Resource Types: AWS::EC2::LaunchTemplate

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

exemptedLaunchTemplates (Optional), Type: CSV

Comma-separated list of exempted EC2 Launch Template IDs that are allowed to have Network Interfaces with the AssociatePublicIpAddress value set to 'true'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-launch-template-tagged

Checks if Amazon EC2 launch templates have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EC2_LAUNCH_TEMPLATE_TAGGED

Resource Types: AWS::EC2::LaunchTemplate

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-managedinstance-applications-blacklisted

Checks if none of the specified applications are installed on the instance. Optionally, specify the version. Newer versions will not be denylisted. Optionally, specify the platform to apply the rule only to instances running that platform.

Identifier: EC2_MANAGEDINSTANCE_APPLICATIONS_BLACKLISTED

Resource Types: AWS::SSM::ManagedInstanceInventory

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

applicationNames, Type: CSV

Comma-separated list of application names. Optionally, specify versions appended with ':' (for example, 'Chrome:0.5.3, Firefox').

> **Note**
>
> The application names must be an exact match. For example, use **`firefox`** on Linux or **`firefox-compat`** on Amazon Linux. In addition, AWS Config does not currently support wildcards for the *applicationNames* parameter (for example, **`firefox*`**).

platformType (Optional), Type: String

Platform type (for example, 'Linux' or 'Windows').

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-managedinstance-applications-required

Checks if all of the specified applications are installed on the instance. Optionally, specify the minimum acceptable version. You can also specify the platform to apply the rule only to instances running that platform.

> **Note**
>
> Ensure that SSM agent is running on the EC2 instance and an association to gather application software inventory is created. The rule returns `NOT_APPLICABLE` if SSM agent is not installed or an association is not yet created or running.

Identifier: EC2_MANAGEDINSTANCE_APPLICATIONS_REQUIRED

Resource Types: AWS::SSM::ManagedInstanceInventory

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

applicationNames, Type: CSV

Comma-separated list of application names. Optionally, specify versions appended with ':' (for example, 'Chrome:0.5.3, Firefox').

> **Note**
>
> The application names must be an exact match. For example, use **`firefox`** on Linux or **`firefox-compat`** on Amazon Linux. In addition, AWS Config does not currently support wildcards for the *applicationNames* parameter (for example, **`firefox*`**).

platformType (Optional), Type: String

Platform type (for example, 'Linux' or 'Windows').

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-managedinstance-association-compliance-status-check

Checks if the status of the AWS Systems Manager association compliance is COMPLIANT or NON_COMPLIANT after the association execution on the instance. The rule is compliant if the field status is COMPLIANT. For more information about associations, see What is an association?.

Identifier: EC2_MANAGEDINSTANCE_ASSOCIATION_COMPLIANCE_STATUS_CHECK

Resource Types: AWS::SSM::AssociationCompliance

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Osaka), Mexico (Central), Asia Pacific (Taipei) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-managedinstance-inventory-blacklisted

Checks whether instances managed by Amazon EC2 Systems Manager are configured to collect blacklisted inventory types.

Identifier: EC2_MANAGEDINSTANCE_INVENTORY_BLACKLISTED

Resource Types: AWS::SSM::ManagedInstanceInventory

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

inventoryNames, Type: CSV

Comma separated list of Systems Manager inventory types (for example, 'AWS:Network, AWS:WindowsUpdate').

platformType (Optional), Type: String

Platform type (for example, 'Linux').

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-managedinstance-patch-compliance-status-check

Checks if the compliance status of the AWS Systems Manager patch compliance is COMPLIANT or NON_COMPLIANT after the patch installation on the instance. The rule is compliant if the field status is COMPLIANT.

Identifier: EC2_MANAGEDINSTANCE_PATCH_COMPLIANCE_STATUS_CHECK

Resource Types: AWS::SSM::PatchCompliance

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (Osaka), Europe (Milan) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-managedinstance-platform-check

Checks whether EC2 managed instances have the desired configurations.

Identifier: EC2_MANAGEDINSTANCE_PLATFORM_CHECK

Resource Types: AWS::SSM::ManagedInstanceInventory

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

platformType, Type: String

Platform type (for example, 'Linux').

agentVersion (Optional), Type: String

Agent version (for example, '2.0.433.0').

platformName (Optional), Type: String

The name of the platform (for example, 'Amazon Linux')

platformVersion (Optional), Type: String

Platform version (for example, '2016.09').

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-meets-restore-time-target

Checks if the restore time of Amazon Elastic Compute Cloud (Amazon EC2) instances meets the specified duration. The rule is NON_COMPLIANT if LatestRestoreExecutionTimeMinutes of an Amazon EC2 instance is greater than maxRestoreTime minutes.

Identifier: EC2_MEETS_RESTORE_TIME_TARGET

Resource Types: AWS::EC2::Instance

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

maxRestoreTime, Type: int

Numerical value for the maximum allowed restore runtime.

resourceId (Optional), Type: String

ID of Amazon EC2 instance for the rule to check.

resourceTags (Optional), Type: String

Tags of Amazon EC2 instances for the rule to check, in JSON format.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-network-insights-access-scope-analysis-tagged

Checks if Amazon EC2 network insights access scope analyses have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EC2_NETWORK_INSIGHTS_ACCESS_SCOPE_ANALYSIS_TAGGED

Resource Types: AWS::EC2::NetworkInsightsAccessScopeAnalysis

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-network-insights-access-scope-tagged

Checks if Amazon EC2 network insights access scopes have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EC2_NETWORK_INSIGHTS_ACCESS_SCOPE_TAGGED

Resource Types: AWS::EC2::NetworkInsightsAccessScope

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-network-insights-analysis-tagged

Checks if Amazon EC2 network insights analyses have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EC2_NETWORK_INSIGHTS_ANALYSIS_TAGGED

Resource Types: AWS::EC2::NetworkInsightsAnalysis

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud

(US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-network-insights-path-tagged

Checks if Amazon EC2 network insights paths have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EC2_NETWORK_INSIGHTS_PATH_TAGGED

Resource Types: AWS::EC2::NetworkInsightsPath

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-no-amazon-key-pair

Checks if running Amazon EC2 instances were launched without key pairs. The rule is NON_COMPLIANT if an instance was launched with a key pair. Evaluation is based on launch-time configuration only.

Identifier: EC2_NO_AMAZON_KEY_PAIR

Resource Types: AWS::EC2::Instance

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-paravirtual-instance-check

Checks if the virtualization type of an EC2 instance is paravirtual. This rule is NON_COMPLIANT for an EC2 instance if 'virtualizationType' is set to 'paravirtual'.

Identifier: EC2_PARAVIRTUAL_INSTANCE_CHECK

Resource Types: AWS::EC2::Instance

Trigger type: Configuration changes

AWS Region: Only available in China (Beijing), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-prefix-list-tagged

Checks if Amazon EC2 managed prefix lists have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EC2_PREFIX_LIST_TAGGED

Resource Types: AWS::EC2::PrefixList

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-resources-in-logically-air-gapped-vault

Checks if Amazon Elastic Compute Cloud (Amazon EC2) instances are in a logically air-gapped vault. The rule is NON_COMPLIANT if an Amazon EC2 instance is not in a logically air-gapped vault within the specified time period.

Identifier: EC2_RESOURCES_IN_LOGICALLY_AIR_GAPPED_VAULT

Resource Types: AWS::EC2::Instance

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

recoveryPointAgeUnit (Optional), Type: String, Default: days

Unit of time for maximum allowed age. Accepted values: 'hours', 'days'.

recoveryPointAgeValue (Optional), Type: int, Default: 1

Numerical value for maximum allowed age. No more than 2184 for hours, 91 for days.

resourceId (Optional), Type: String

ID of Amazon EC2 instance for the rule to check.

resourceTags (Optional), Type: String

Tags of Amazon EC2 instances for the rule to check, in JSON format.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-resources-protected-by-backup-plan

Checks if Amazon Elastic Compute Cloud (Amazon EC2) instances are protected by a backup plan. The rule is NON_COMPLIANT if the Amazon EC2 instance is not covered by a backup plan.

> **Note**
>
> This rule is only applicable to running Amazon EC2 instances and not to instances that are powered down.

Identifier: EC2_RESOURCES_PROTECTED_BY_BACKUP_PLAN

Resource Types: AWS::EC2::Instance

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

backupVaultLockCheck (Optional), Type: String

Accepted values: 'True' or 'False'. Enter 'True' for the rule to check if the resource is backed up in a locked vault

crossAccountList (Optional), Type: String

Comma-separated list of destination accounts for cross-account backup copy to be kept

crossRegionList (Optional), Type: String

Comma-separated list of destination regions for the cross-region backup copy to be kept

maxRetentionDays (Optional), Type: int

The maximum retention period in days for the Backup Vault Lock

minRetentionDays (Optional), Type: int

The minimum retention period in days for the Backup Vault Lock

resourceId (Optional), Type: String

ID of Amazon EC2 instance for the rule to check.

resourceTags (Optional), Type: String

Tags for Amazon EC2 instances for the rule to check, in JSON format `{"tagkey" : "tagValue"}`.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-security-group-attached-to-eni

Checks that non-default security groups are attached to Amazon Elastic Compute Cloud (EC2) instances or an elastic network interfaces (ENIs). The rule returns NON_COMPLIANT if the security group is not associated with an EC2 instance or an ENI.

Identifier: EC2_SECURITY_GROUP_ATTACHED_TO_ENI

Resource Types: AWS::EC2::SecurityGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-security-group-attached-to-eni-periodic

Checks if non-default security groups are attached to Elastic network interfaces (ENIs). The rule is NON_COMPLIANT if the security group is not associated with an ENI. Security groups not owned by the calling account evaluate as NOT_APPLICABLE.

> **Note**
>
> This rule reports on the `AWS::EC2::SecurityGroup` resource type. However, in order for the rule to run effectively, you must enable the recording of the `AWS::EC2::NetworkInterface` resource type.

Identifier: EC2_SECURITY_GROUP_ATTACHED_TO_ENI_PERIODIC

Resource Types: AWS::EC2::SecurityGroup

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-spot-fleet-request-ct-encryption-at-rest

Checks if Amazon EC2 Spot Fleet request launch parameters set encrypted to True for attached EBS volumes. The rule is NON_COMPLIANT if any EBS volumes has encrypted set to False. The rule does not evaluate spot fleet requests using launch templates.

Identifier: EC2_SPOT_FLEET_REQUEST_CT_ENCRYPTION_AT_REST

Resource Types: AWS::EC2::SpotFleet

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-stopped-instance

Checks if there are Amazon Elastic Compute Cloud (Amazon EC2) instances stopped for more than the allowed number of days. The rule is NON_COMPLIANT if the state of an Amazon EC2 instance has been stopped for longer than the allowed number of days, or if the amount of time cannot be determined.

Identifier: EC2_STOPPED_INSTANCE

Resource Types: AWS::EC2::Instance

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

AllowedDays (Optional), Type: int, Default: 30

The number of days an Amazon EC2 instance can be stopped before the rule is NON_COMPLIANT. The default number of days is 30.

> **Note**
>
> The number of days selected needs to be less than the configured retention period since this rule relies on the historical data collected. For more information about historical data retention, see Deleting AWS Config Data.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-token-hop-limit-check

Checks if an Amazon Elastic Compute Cloud (EC2) instance metadata has a specified token hop limit that is below the desired limit. The rule is NON_COMPLIANT for an instance if it has a hop limit value above the intended limit.

Identifier: EC2_TOKEN_HOP_LIMIT_CHECK

Resource Types: AWS::EC2::Instance

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

tokenHopLimit (Optional), Type: int

> The desired token hop limit. Valid values are between 1 and 64, both inclusive. Default value is 1 if parameter is not specified.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-traffic-mirror-filter-description

Checks if Amazon EC2 traffic mirror filters have a description. The rule is NON_COMPLIANT if configuration.Description does not exist.

Identifier: EC2_TRAFFIC_MIRROR_FILTER_DESCRIPTION

Resource Types: AWS::EC2::TrafficMirrorFilter

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-traffic-mirror-filter-tagged

Checks if Amazon EC2 traffic mirror filters have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EC2_TRAFFIC_MIRROR_FILTER_TAGGED

Resource Types: AWS::EC2::TrafficMirrorFilter

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-traffic-mirror-session-description

Checks if Amazon EC2 traffic mirror sessions have a description. The rule is NON_COMPLIANT if configuration.Description does not exist.

Identifier: EC2_TRAFFIC_MIRROR_SESSION_DESCRIPTION

Resource Types: AWS::EC2::TrafficMirrorSession

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Europe (Milan), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-traffic-mirror-session-tagged

Checks if Amazon EC2 traffic mirror sessions have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EC2_TRAFFIC_MIRROR_SESSION_TAGGED

Resource Types: AWS::EC2::TrafficMirrorSession

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Europe (Milan), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-traffic-mirror-target-description

Checks if Amazon EC2 traffic mirror targets have a description. The rule is NON_COMPLIANT if configuration.Description does not exist.

Identifier: EC2_TRAFFIC_MIRROR_TARGET_DESCRIPTION

Resource Types: AWS::EC2::TrafficMirrorTarget

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-traffic-mirror-target-tagged

Checks if Amazon EC2 traffic mirror targets have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EC2_TRAFFIC_MIRROR_TARGET_TAGGED

Resource Types: AWS::EC2::TrafficMirrorTarget

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-transit-gateway-auto-vpc-attach-disabled

Checks if Amazon Elastic Compute Cloud (Amazon EC2) Transit Gateways have 'AutoAcceptSharedAttachments' enabled. The rule is NON_COMPLIANT for a Transit Gateway if 'AutoAcceptSharedAttachments' is set to 'enable'.

Identifier: EC2_TRANSIT_GATEWAY_AUTO_VPC_ATTACH_DISABLED

Resource Types: AWS::EC2::TransitGateway

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing), Asia Pacific (Osaka), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-transit-gateway-multicast-domain-tagged

Checks if Amazon EC2 transit gateway multicast domains have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EC2_TRANSIT_GATEWAY_MULTICAST_DOMAIN_TAGGED

Resource Types: AWS::EC2::TransitGatewayMulticastDomain

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-volume-inuse-check

Checks if EBS volumes are attached to EC2 instances. Optionally checks if EBS volumes are marked for deletion when an instance is terminated. The rule is COMPLIANT if an EBS volume is attached to running or stopped EC2 instances. The rule is NON_COMPLIANT if an EBS volume is not attached to any EC2 instance or is attached to a terminated EC2 instance. This rule may briefly report a transient NON_COMPLIANT status shortly after EC2 instance lifecycle events. This transient evaluation self-corrects when AWS Config re-evaluates the resource after EC2 completes the state propagation.

Identifier: EC2_VOLUME_INUSE_CHECK

Resource Types: AWS::EC2::Volume

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

deleteOnTermination (Optional), Type: boolean

EBS volumes are marked for deletion when an instance is terminated. Possible values: True or False (other input values are marked as NON_COMPLIANT). If set to `True`, the rule is NON_COMPLIANT if a terminated EBS volume is not marked for deletion.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-vpn-connection-ike-version-check

Checks if an Amazon EC2 VPN connection is configured to use only IKEv2 protocol. The rule is NON_COMPLIANT if the VPN connection's tunnel allows IKE versions other than IKEv2.

Identifier: EC2_VPN_CONNECTION_IKE_VERSION_CHECK

Resource Types: AWS::EC2::VPNConnection

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Middle East (Bahrain), China (Beijing), Middle East (UAE), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-vpn-connection-logging-enabled

Checks if AWS Site-to-Site VPN connections have Amazon CloudWatch logging enabled for both tunnels. The rule is NON_COMPLIANT if a Site-to-Site VPN connection does not have CloudWatch logging enabled for either or both tunnels.

Identifier: EC2_VPN_CONNECTION_LOGGING_ENABLED

Resource Types: AWS::EC2::VPNConnection

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-vpn-connection-tagged

Checks if Amazon EC2 VPN connections have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EC2_VPN_CONNECTION_TAGGED

Resource Types: AWS::EC2::VPNConnection

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ecr-private-image-scanning-enabled

Checks if a private Amazon Elastic Container Registry (Amazon ECR) repository has image scanning enabled. The rule is NON_COMPLIANT if the private Amazon ECR repository's scan frequency is not on scan on push or continuous scan. For more information on enabling image scanning, see Image scanning in the *Amazon ECR User Guide*.

Identifier: ECR_PRIVATE_IMAGE_SCANNING_ENABLED

Resource Types: AWS::ECR::Repository

Trigger type: Periodic

AWS Region: All supported AWS regions except China (Beijing), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ecr-private-lifecycle-policy-configured

Checks if a private Amazon Elastic Container Registry (ECR) repository has at least one lifecycle policy configured. The rule is NON_COMPLIANT if no lifecycle policy is configured for the ECR private repository.

Identifier: ECR_PRIVATE_LIFECYCLE_POLICY_CONFIGURED

Resource Types: AWS::ECR::Repository

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ecr-private-tag-immutability-enabled

Checks if a private Amazon Elastic Container Registry (ECR) repository has tag immutability enabled. This rule is NON_COMPLIANT if tag immutability is not enabled for the private ECR repository.

Identifier: ECR_PRIVATE_TAG_IMMUTABILITY_ENABLED

Resource Types: AWS::ECR::Repository

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ecr-repository-cmk-encryption-enabled

Checks if ECR repository is encrypted at rest using customer-managed KMS key. This rule is NON_COMPLIANT if the repository is encrypted using AES256 or the default KMS key ('aws/ecr').

Identifier: ECR_REPOSITORY_CMK_ENCRYPTION_ENABLED

Resource Types: AWS::ECR::Repository

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Canada West (Calgary) Region

Parameters:

kmsKeyArns (Optional), Type: CSV

> Comma-separated list of KMS key Amazon Resource Names (ARNs) intended to encrypt the ECR repository.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ecr-repository-tagged

Checks if Amazon ECR repositories have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: ECR_REPOSITORY_TAGGED

Resource Types: AWS::ECR::Repository

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ecs-awsvpc-networking-enabled

Checks if the networking mode for active ECSTaskDefinitions is set to ‘awsvpc’. This rule is NON_COMPLIANT if active ECSTaskDefinitions is not set to ‘awsvpc’.

> **Note**
>
> This rule only evaluates the latest active revision of an Amazon ECS task definition.

Identifier: ECS_AWSVPC_NETWORKING_ENABLED

Resource Types: AWS::ECS::TaskDefinition

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ecs-capacity-provider-tagged

Checks if Amazon ECS capacity providers have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: ECS_CAPACITY_PROVIDER_TAGGED

Resource Types: AWS::ECS::CapacityProvider

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ecs-capacity-provider-termination-check

Checks if an Amazon ECS Capacity provider containing Auto Scaling groups has managed termination protection enabled. This rule is NON_COMPLIANT if managed termination protection is disabled on the ECS Capacity Provider.

Identifier: ECS_CAPACITY_PROVIDER_TERMINATION_CHECK

Resource Types: AWS::ECS::CapacityProvider

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ecs-containers-nonprivileged

Checks if the privileged parameter in the container definition of ECSTaskDefinitions is set to 'true'. The rule is NON_COMPLIANT if the privileged parameter is 'true'.

> **Note**
>
> This rule only evaluates the latest active revision of an Amazon ECS task definition.

Identifier: ECS_CONTAINERS_NONPRIVILEGED

Resource Types: AWS::ECS::TaskDefinition

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ecs-containers-readonly-access

Checks if Amazon Elastic Container Service (Amazon ECS) Containers only have read-only access to its root filesystems. The rule is NON_COMPLIANT if the readonlyRootFilesystem parameter in the container definition of ECSTaskDefinitions is set to 'false'.

> **Note**
>
> This rule only evaluates the latest active revision of an Amazon ECS task definition.

Identifier: ECS_CONTAINERS_READONLY_ACCESS

Resource Types: AWS::ECS::TaskDefinition

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ecs-container-insights-enabled

Checks if Amazon Elastic Container Service clusters have container insights enabled. The rule is NON_COMPLIANT if container insights are not enabled.

Identifier: ECS_CONTAINER_INSIGHTS_ENABLED

Resource Types: AWS::ECS::Cluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ecs-fargate-latest-platform-version

Checks if ECS Fargate services is set to the latest platform version. The rule is NON_COMPLIANT if PlatformVersion for the Fargate launch type is not set to LATEST, or if neither latestLinuxVersion nor `latestWindowsVersion` are provided as parameters.

Identifier: ECS_FARGATE_LATEST_PLATFORM_VERSION

Resource Types: AWS::ECS::Service

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

latestLinuxVersion (Optional), Type: String

Latest Linux supported 'PlatformVersion' in semantic versioning (SemVer) format. Parameter may be needed if Fargate was deployed and the 'PlatformVersion' was explicitly specified or CodeDeploy is used as the 'DeploymentController'

latestWindowsVersion (Optional), Type: String

Latest Windows supported 'PlatformVersion' in semantic versioning (SemVer) format. Parameter may be needed if Fargate was deployed and the 'PlatformVersion' was explicitly specified or CodeDeploy is used as the 'DeploymentController'

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ecs-no-environment-secrets

Checks if secrets are passed as container environment variables. The rule is NON_COMPLIANT if 1 or more environment variable key matches a key listed in the '`secretKeys`' parameter (excluding environmental variables from other locations such as Amazon S3).

> **Note**
>
> This rule only evaluates the latest active revision of an Amazon ECS task definition.

Identifier: ECS_NO_ENVIRONMENT_SECRETS

Resource Types: AWS::ECS::TaskDefinition

Trigger type: Configuration changes

AWS Region: All supported AWS regions except AWS GovCloud (US-East), AWS GovCloud (US-West) Region

Parameters:

secretKeys, Type: CSV

Comma-separated list of key names to search for in the environment variables of container definitions within Task Definitions. Extra spaces will be removed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ecs-service-propagate-tags-enabled

Checks if AWS ECS Service has property PropagateTags with value of either SERVICE or TASK_DEFINITION. The rule is NON_COMPLIANT if the property does not exist or is NONE.

Identifier: ECS_SERVICE_PROPAGATE_TAGS_ENABLED

Resource Types: AWS::ECS::Service

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ecs-task-definition-efs-encryption-enabled

Checks if Amazon ECS Task Definitions with EFS volumes have in-transit encryption enabled. The rule is NON_COMPLIANT if an ECS Task Definition contains an EFS volume without transit encryption enabled.

Identifier: ECS_TASK_DEFINITION_EFS_ENCRYPTION_ENABLED

Resource Types: AWS::ECS::TaskDefinition

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ecs-task-definition-linux-user-non-root

Checks if the latest active revision of an Amazon ECS task definition configures Linux containers to run as non-root users.The rule is NON_COMPLIANT if root user is specified or user configuration is absent for any container.

Identifier: ECS_TASK_DEFINITION_LINUX_USER_NON_ROOT

Resource Types: AWS::ECS::TaskDefinition

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ecs-task-definition-log-configuration

Checks if logConfiguration is set on active ECS Task Definitions. This rule is NON_COMPLIANT if an active ECSTaskDefinition does not have the logConfiguration resource defined or the value for logConfiguration is null in at least one container definition.

> **Note**
>
> This rule only evaluates the latest active revision of an Amazon ECS task definition.

Identifier: ECS_TASK_DEFINITION_LOG_CONFIGURATION

Resource Types: AWS::ECS::TaskDefinition

Trigger type: Configuration changes

AWS Region: All supported AWS regions except AWS GovCloud (US-East), AWS GovCloud (US-West) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ecs-task-definition-memory-hard-limit

Checks if Amazon Elastic Container Service (ECS) task definitions have a set memory limit for its container definitions. The rule is NON_COMPLIANT for a task definition if the 'memory' parameter is absent for one container definition.

> **Warning**
>
> As of April 3, 2026, AWS Config has discontinued support for this managed rule. Evaluation results will no longer be generated.

Identifier: ECS_TASK_DEFINITION_MEMORY_HARD_LIMIT

Resource Types: AWS::ECS::TaskDefinition

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ecs-task-definition-network-mode-not-host

Checks if the latest active revision of Amazon ECS task definitions use host network mode. The rule is NON_COMPLIANT if the latest active revision of the ECS task definition uses host network mode.

Identifier: ECS_TASK_DEFINITION_NETWORK_MODE_NOT_HOST

Resource Types: AWS::ECS::TaskDefinition

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ecs-task-definition-nonroot-user

Checks if ECSTaskDefinitions specify a user for Amazon Elastic Container Service (Amazon ECS) EC2 launch type containers to run on. The rule is NON_COMPLIANT if the 'user' parameter is not present or set to 'root'.

> **Note**
>
> This rule only evaluates the latest active revision of an Amazon ECS task definition.

Identifier: ECS_TASK_DEFINITION_NONROOT_USER

Resource Types: AWS::ECS::TaskDefinition

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ecs-task-definition-pid-mode-check

Checks if ECSTaskDefinitions are configured to share a host's process namespace with its Amazon Elastic Container Service (Amazon ECS) containers. The rule is NON_COMPLIANT if the pidMode parameter is set to 'host'.

> **Note**
>
> This rule only evaluates the latest active revision of an Amazon ECS task definition.

Identifier: ECS_TASK_DEFINITION_PID_MODE_CHECK

Resource Types: AWS::ECS::TaskDefinition

Trigger type: Configuration changes

AWS Region: All supported AWS regions except AWS GovCloud (US-East), AWS GovCloud (US-West) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ecs-task-definition-user-for-host-mode-check

Checks if Amazon ECS task definitions with host network mode have privileged OR nonroot in the container definition. The rule is NON_COMPLIANT if the latest active revision of a task definition has privileged=false (or is null) AND user=root (or is null).

> **Important**
>
> **Only one condition needs to be met for the rule to return compliant**
> The rule is COMPLIANT in any of following scenarios:
>
> - If the network mode is not set to host,
> - If the latest active revision of a task definition has privileged=true,
> - If the latest active revision of a task definition has a user that is not the root.
>
> This means that only one of these conditions need to be met for the rule to return compliant. To check specifically if a task definition has privileged=true, see ecs-containers-

nonprivileged. To check specifically if a task definition has a user that is not the root, see ecs-task-definition-nonroot-user.

Identifier: ECS_TASK_DEFINITION_USER_FOR_HOST_MODE_CHECK

Resource Types: AWS::ECS::TaskDefinition

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

SkipInactiveTaskDefinitions (Optional), Type: boolean

Boolean flag to not check INACTIVE Amazon EC2 task definitions. If set to 'true', the rule won't evaluate INACTIVE Amazon EC2 task definitions. If set to 'false', the rule will evaluate the latest revision of INACTIVE Amazon EC2 task definitions.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ecs-task-definition-windows-user-non-admin

Checks if the latest active revision of an Amazon ECS task definition configures Windows containers to run as non-administrator users. The rule is NON_COMPLIANT if default administrator user is specified or user configuration is absent for any container.

Identifier: ECS_TASK_DEFINITION_WINDOWS_USER_NON_ADMIN

Resource Types: AWS::ECS::TaskDefinition

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

efs-access-point-enforce-root-directory

Checks if Amazon Elastic File System (Amazon EFS) access points are configured to enforce a root directory. The rule is NON_COMPLIANT if the value of 'Path' is set to '/' (default root directory of the file system).

Identifier: EFS_ACCESS_POINT_ENFORCE_ROOT_DIRECTORY

Resource Types: AWS::EFS::AccessPoint

Trigger type: Configuration changes

AWS Region: All supported AWS regions except AWS GovCloud (US-East), AWS GovCloud (US-West), China (Ningxia) Region

Parameters:

approvedDirectories (Optional), Type: CSV

Comma-separated list of subdirectory paths that are approved for Amazon EFS access point root directory enforcement.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

efs-access-point-enforce-user-identity

Checks if Amazon Elastic File System (Amazon EFS) access points are configured to enforce a user identity. The rule is NON_COMPLIANT if 'PosixUser' is not defined or if parameters are provided and there is no match in the corresponding parameter.

Identifier: EFS_ACCESS_POINT_ENFORCE_USER_IDENTITY

Resource Types: AWS::EFS::AccessPoint

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Ningxia) Region

Parameters:

approvedGids (Optional), Type: CSV

Comma-separated list of POSIX group IDs that are approved for EFS access point user enforcement.

approvedUids (Optional), Type: CSV

Comma-separated list of POSIX user ID that are approved for EFS access point user enforcement.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

efs-access-point-tagged

Checks if Amazon Elastic File System (Amazon EFS) access points have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present.

Identifier: EFS_ACCESS_POINT_TAGGED

Resource Types: AWS::EFS::AccessPoint

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Middle East (Bahrain), Middle East (UAE), AWS GovCloud (US-East), AWS GovCloud (US-West) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

efs-automatic-backups-enabled

Checks if an Amazon Elastic File System (Amazon EFS) file system has automatic backups enabled. The rule is NON_COMPLIANT if `BackupPolicy.Status` is set to DISABLED.

Identifier: EFS_AUTOMATIC_BACKUPS_ENABLED

Resource Types: AWS::EFS::FileSystem

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

efs-encrypted-check

Checks if Amazon Elastic File System (Amazon EFS) is configured to encrypt the file data using AWS Key Management Service (AWS KMS). The rule is NON_COMPLIANT if the encrypted key is set to false on `DescribeFileSystems` or if the `KmsKeyId` key on `DescribeFileSystems` does not match the `KmsKeyId` parameter.

Identifier: EFS_ENCRYPTED_CHECK

Resource Types: AWS::EFS::FileSystem

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

KmsKeyId (Optional), Type: String

Amazon Resource Name (ARN) of the KMS key that is used to encrypt the EFS file system.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

efs-filesystem-ct-encrypted

Checks if Amazon Elastic File System (Amazon EFS) encrypts data with AWS Key Management Service (AWS KMS). The rule is NON_COMPLIANT if a file system is not encrypted. Optionally, you can check if a file system is not encrypted with specified KMS keys.

Identifier: EFS_FILESYSTEM_CT_ENCRYPTED

Resource Types: AWS::EFS::FileSystem

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Canada West (Calgary) Region

Parameters:

kmsKeyArns (Optional), Type: String

(Optional) Comma-separated list of Amazon Resource Names (ARNs) for AWS KMS keys. If provided, the rule checks if the specified KMS keys do not encrypt an Amazon EFS file system.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

efs-filesystem-multi-az

Checks if an Amazon EFS file system is deployed across multiple Availability Zones. The rule is NON_COMPLIANT if 'configuration.AvailabilityZoneName' is present.

Identifier: EFS_FILESYSTEM_MULTI_AZ

Resource Types: AWS::EFS::FileSystem

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Middle East (Bahrain), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

efs-file-system-tagged

Checks if Amazon Elastic File System file systems have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EFS_FILE_SYSTEM_TAGGED

Resource Types: AWS::EFS::FileSystem

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

efs-in-backup-plan

Checks if Amazon Elastic File System (Amazon EFS) file systems are added in the backup plans of AWS Backup. The rule is NON_COMPLIANT if EFS file systems are not included in the backup plans.

Identifier: EFS_IN_BACKUP_PLAN

Resource Types: AWS::EFS::FileSystem

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

efs-last-backup-recovery-point-created

Checks if a recovery point was created for Amazon Elastic File System (Amazon EFS) File Systems. The rule is NON_COMPLIANT if the Amazon EFS File System does not have a corresponding Recovery Point created within the specified time period.

Identifier: EFS_LAST_BACKUP_RECOVERY_POINT_CREATED

Resource Types: AWS::EFS::FileSystem

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

recoveryPointAgeUnit (Optional), Type: String, Default: days

Unit of time for maximum allowed age. Accepted values: 'hours', 'days'.

recoveryPointAgeValue (Optional), Type: int, Default: 1

Numerical value for maximum allowed age. No more than 744 for hours, 31 for days.

resourceId (Optional), Type: String

ID of EFS File System for the rule to check.

resourceTags (Optional), Type: String

Tags of Amazon EFS File Systems for the rule to check, in JSON format `{"tagkey" : "tagValue"}`.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

efs-meets-restore-time-target

Checks if the restore time of Amazon Elastic File System (Amazon EFS) File Systems meets the specified duration. The rule is NON_COMPLIANT if LatestRestoreExecutionTimeMinutes of an Amazon EFS File System is greater than maxRestoreTime minutes.

Identifier: EFS_MEETS_RESTORE_TIME_TARGET

Resource Types: AWS::EFS::FileSystem

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

maxRestoreTime, Type: int

Numerical value for the maximum allowed restore runtime.

resourceId (Optional), Type: String

ID of EFS File System for the rule to check.

resourceTags (Optional), Type: String

Tags of Amazon EFS File Systems for the rule to check, in JSON format.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

efs-mount-target-public-accessible

Checks if an Amazon Elastic File System (Amazon EFS) is associated with subnets that assign public IP addresses on launch. The rule is NON_COMPLIANT if the Amazon EFS mount target is associated with subnets that assign public IP addresses on launch.

Identifier: EFS_MOUNT_TARGET_PUBLIC_ACCESSIBLE

Resource Types: AWS::EFS::FileSystem

Trigger type: Periodic

AWS Region: All supported AWS regions except China (Beijing), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

efs-resources-in-logically-air-gapped-vault

Checks if Amazon Elastic File System (Amazon EFS) File Systems are in a logically air-gapped vault. The rule is NON_COMPLIANT if an Amazon EFS File System is not in a logically air-gapped vault within the specified time period.

Identifier: EFS_RESOURCES_IN_LOGICALLY_AIR_GAPPED_VAULT

Resource Types: AWS::EFS::FileSystem

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

recoveryPointAgeUnit (Optional), Type: String, Default: days

Unit of time for maximum allowed age. Accepted values: 'hours', 'days'.

recoveryPointAgeValue (Optional), Type: int, Default: 1

Numerical value for maximum allowed age. No more than 2184 for hours, 91 for days.

resourceId (Optional), Type: String

ID of EFS File System for the rule to check.

resourceTags (Optional), Type: String

Tags of Amazon EFS File Systems for the rule to check, in JSON format.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

efs-resources-protected-by-backup-plan

Checks if Amazon Elastic File System (Amazon EFS) File Systems are protected by a backup plan. The rule is NON_COMPLIANT if the EFS File System is not covered by a backup plan.

Identifier: EFS_RESOURCES_PROTECTED_BY_BACKUP_PLAN

Resource Types: AWS::EFS::FileSystem

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

backupVaultLockCheck (Optional), Type: String

Accepted values: 'True' or 'False'. Enter 'True' for the rule to check if the resource is backed up in a locked vault

crossAccountList (Optional), Type: String

Comma-separated list of destination accounts for cross-account backup copy to be kept

crossRegionList (Optional), Type: String

Comma-separated list of destination regions for the cross-region backup copy to be kept

maxRetentionDays (Optional), Type: int

The maximum retention period in days for the Backup Vault Lock

minRetentionDays (Optional), Type: int

The minimum retention period in days for the Backup Vault Lock

resourceId (Optional), Type: String

ID of the EFS File System for the rule to check.

resourceTags (Optional), Type: String

Tags for EFS File Systems for the rule to check, in JSON format `{"tagkey" : "tagValue"}`.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

eip-attached

Checks whether Elastic IP addresses allocated to your account are in use. The rule is NON_COMPLIANT if an EIP is not attached to an EC2 instance or an in-use network interface.

> **Note**
>
> Results might take up to 6 hours to become available after an evaluation occurs.

Identifier: EIP_ATTACHED

Resource Types: AWS::EC2::EIP

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

Proactive Evaluation

For steps on how to run this rule in proactive mode, see Evaluating Your Resources with AWS Config Rules. For this rule to return COMPLIANT in proactive mode, the resource configuration schema for the StartResourceEvaluation API needs to include the following inputs, encoded as a string:

```
"ResourceConfiguration":
...
{
   "InstanceId": "my-instance-Id"
}
...
```

For more information on proactive evaluation, see Evaluation Mode.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

eks-addon-tagged

Checks if Amazon EKS add-ons have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EKS_ADDON_TAGGED

Resource Types: AWS::EKS::Addon

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

eks-cluster-logging-enabled

Checks if an Amazon Elastic Kubernetes Service (Amazon EKS) cluster is configured with logging enabled. The rule is NON_COMPLIANT if logging for Amazon EKS clusters is not enabled for all log types.

Identifier: EKS_CLUSTER_LOGGING_ENABLED

Resource Types: AWS::EKS::Cluster

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

eks-cluster-log-enabled

Checks if an Amazon Elastic Kubernetes Service (Amazon EKS) cluster is configured with logging enabled. The rule is NON_COMPLIANT if logging for Amazon EKS clusters is not enabled or if logging is not enabled with the log type mentioned.

Identifier: EKS_CLUSTER_LOG_ENABLED

Resource Types: AWS::EKS::Cluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

logTypes (Optional), Type: CSV

> Comma-separated list of EKS Cluster control plane log types for the rule to check. Valid values: "api", "audit", "authenticator", "controllerManager", "scheduler

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

eks-cluster-oldest-supported-version

Checks if an Amazon Elastic Kubernetes Service (EKS) cluster is running the oldest supported version. The rule is NON_COMPLIANT if an EKS cluster is running oldest supported version (equal to the parameter '`oldestVersionSupported`').

Identifier: EKS_CLUSTER_OLDEST_SUPPORTED_VERSION

Resource Types: AWS::EKS::Cluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

oldestVersionSupported, Type: String

Value of the oldest version of Kubernetes supported on AWS.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

eks-cluster-secrets-encrypted

Checks if Amazon EKS clusters are configured to have Kubernetes secrets encrypted using AWS KMS. The rule is NON_COMPLIANT if an EKS cluster does not have an encryptionConfig resource or if encryptionConfig does not name secrets as a resource.

Identifier: EKS_CLUSTER_SECRETS_ENCRYPTED

Resource Types: AWS::EKS::Cluster

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

kmsKeyArns (Optional), Type: CSV

Comma-separated list of KMS key Amazon Resource Names (ARNs) that are approved for EKS usage.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

eks-cluster-supported-version

Checks if an Amazon Elastic Kubernetes Service (EKS) cluster is running a supported Kubernetes version. This rule is NON_COMPLIANT if an EKS cluster is running an unsupported version (less than the parameter '`oldestVersionSupported`').

Identifier: EKS_CLUSTER_SUPPORTED_VERSION

Resource Types: AWS::EKS::Cluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

oldestVersionSupported, Type: String

Value of the oldest version of Kubernetes supported on AWS.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

eks-endpoint-no-public-access

Checks if the Amazon Elastic Kubernetes Service (Amazon EKS) endpoint is not publicly accessible. The rule is NON_COMPLIANT if the endpoint is publicly accessible.

Identifier: EKS_ENDPOINT_NO_PUBLIC_ACCESS

Resource Types: AWS::EKS::Cluster

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

eks-fargate-profile-tagged

Checks if Amazon EKS fargate profiles have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EKS_FARGATE_PROFILE_TAGGED

Resource Types: AWS::EKS::FargateProfile

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

eks-nodegroup-supported-version-check

Checks if an Amazon Elastic Kubernetes Service (EKS) nodegroup is running the oldest supported version.

Identifier: EKS_NODEGROUP_SUPPORTED_VERSION_CHECK

Resource Types: AWS::EKS::Nodegroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Middle East (Bahrain), Middle East (UAE) Region

Parameters:

oldestVersionSupported, Type: String

Value of the oldest version of Kubernetes supported on AWS.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

eks-secrets-encrypted

Checks if Amazon Elastic Kubernetes Service clusters are configured to have Kubernetes secrets encrypted using AWS Key Management Service (KMS) keys.

- This rule is COMPLIANT if an EKS cluster has an encryptionConfig with secrets as one of the resources.
- This rule is also COMPLIANT if the key used to encrypt EKS secrets matches with the parameter.
- This rule is NON_COMPLIANT if an EKS cluster does not have an encryptionConfig or if the encryptionConfig resources do not include secrets.
- This rule is also NON_COMPLIANT if the key used to encrypt EKS secrets does not match with the parameter.

Identifier: EKS_SECRETS_ENCRYPTED

Resource Types: AWS::EKS::Cluster

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand) Region

Parameters:

kmsKeyArns (Optional), Type: CSV

Comma separated list of Amazon Resource Name (ARN) of the KMS key that should be used for encrypted secrets in an EKS cluster.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elasticache-automatic-backup-check-enabled

Checks if Amazon ElastiCache clusters (Valkey or Redis OSS) have automatic backup turned on. The rule is NON_COMPLIANT if automated backup is not enabled or the SnapshotRetentionLimit for a cluster is less than the specified `snapshotRetentionPeriod`.

Identifier: ELASTICACHE_AUTOMATIC_BACKUP_CHECK_ENABLED

Resource Types: AWS::ElastiCache::CacheCluster

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

snapshotRetentionPeriod (Optional), Type: int

Minimum snapshot retention period in days for Valkey or Redis OSS. Valid values are 1 to 35. Default value is 1.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elasticache-auto-minor-version-upgrade-check

Checks if Amazon ElastiCache clusters have auto minor version upgrades enabled. The rule is NON_COMPLIANT for an ElastiCache cluster if it is using the Redis or Valkey engine and 'AutoMinorVersionUpgrade' is not set to 'true'.

Identifier: ELASTICACHE_AUTO_MINOR_VERSION_UPGRADE_CHECK

Resource Types: AWS::ElastiCache::CacheCluster

Trigger type: Periodic

AWS Region: All supported AWS regions except Middle East (UAE), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elasticache-rbac-auth-enabled

Checks if Amazon ElastiCache replication groups have RBAC authentication enabled. The rule is NON_COMPLIANT if the Redis version is 6 or above and 'UserGroupIds' is missing, empty, or does not match an entry provided by the '`allowedUserGroupIDs`' parameter.

Identifier: ELASTICACHE_RBAC_AUTH_ENABLED

Resource Types: AWS::ElastiCache::ReplicationGroup

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

allowedUserGroupIDs (Optional), Type: CSV

> A comma-separated list of User Group IDs that are approved for ElastiCache replication group access.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elasticache-redis-cluster-automatic-backup-check

Check if the Amazon ElastiCache Redis clusters have automatic backup turned on. The rule is NON_COMPLIANT if the SnapshotRetentionLimit for Redis cluster is less than the SnapshotRetentionPeriod parameter. For example: If the parameter is 15 then the rule is non-compliant if the snapshotRetentionPeriod is between 0-15.

Identifier: ELASTICACHE_REDIS_CLUSTER_AUTOMATIC_BACKUP_CHECK

Resource Types: AWS::ElastiCache::CacheCluster, AWS::ElastiCache::ReplicationGroup

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (Taipei) Region

Parameters:

snapshotRetentionPeriod (Optional), Type: int, Default: 15

Minimum snapshot retention period in days for Redis cluster. Default is 15 days.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elasticache-repl-grp-auto-failover-enabled

Checks if Amazon ElastiCache Redis replication groups have automatic failover enabled. The rule is NON_COMPLIANT for an ElastiCache replication group if 'AutomaticFailover' is not set to 'enabled'.

Identifier: ELASTICACHE_REPL_GRP_AUTO_FAILOVER_ENABLED

Resource Types: AWS::ElastiCache::ReplicationGroup

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elasticache-repl-grp-encrypted-at-rest

Checks if Amazon ElastiCache replication groups have encryption-at-rest enabled. The rule is NON_COMPLIANT for an ElastiCache replication group if 'AtRestEncryptionEnabled' is disabled or if the KMS key ARN does not match the approvedKMSKeyArns parameter.

Identifier: ELASTICACHE_REPL_GRP_ENCRYPTED_AT_REST

Resource Types: AWS::ElastiCache::ReplicationGroup

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Canada West (Calgary) Region

Parameters:

approvedKMSKeyIds (Optional), Type: CSV

Comma-separated list of KMS Key IDs that are approved for ElastiCache usage.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elasticache-repl-grp-encrypted-in-transit

Checks if Amazon ElastiCache replication groups have encryption-in-transit enabled. The rule is NON_COMPLIANT for an ElastiCache replication group if ‘TransitEncryptionEnabled’ is set to ‘false’.

Identifier: ELASTICACHE_REPL_GRP_ENCRYPTED_IN_TRANSIT

Resource Types: AWS::ElastiCache::ReplicationGroup

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elasticache-repl-grp-redis-auth-enabled

Checks if Amazon ElastiCache replication groups have Redis AUTH enabled. The rule is NON_COMPLIANT for an ElastiCache replication group if the Redis version of its nodes is below 6 (Version 6+ use Redis ACLs) and 'AuthToken' is missing or is empty/null.

Identifier: ELASTICACHE_REPL_GRP_REDIS_AUTH_ENABLED

Resource Types: AWS::ElastiCache::ReplicationGroup

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elasticache-subnet-group-check

Checks if Amazon ElastiCache clusters are configured with a custom subnet group. The rule is NON_COMPLIANT for an ElastiCache cluster if it is using a default subnet group.

Identifier: ELASTICACHE_SUBNET_GROUP_CHECK

Resource Types: AWS::ElastiCache::CacheCluster

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elasticache-supported-engine-version

Checks if ElastiCache clusters are running a version greater or equal to the recommended engine version. The rule is NON_COMPLIANT if the 'EngineVersion' for an ElastiCache cluster is less than the specified recommended version for its given engine.

Identifier: ELASTICACHE_SUPPORTED_ENGINE_VERSION

Resource Types: AWS::ElastiCache::CacheCluster

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

latestMemcachedVersion, Type: String

The latest recommended engine version for Memcached. Valid values are in semantic versioning (SemVer) format with 3-component number for major, minor, and patch versions (for example, 1.6.6, not 1.6).

latestRedisVersion, Type: String

The latest recommended engine version for Redis. Valid values are in semantic versioning (SemVer) format with 3-component number for major, minor, and patch versions (for example, 7.0.5, not 7.0).

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elasticbeanstalk-application-description

Checks if AWS Elastic Beanstalk applications have a description. The rule is NON_COMPLIANT if configuration.description does not exist or is an empty string.

Identifier: ELASTICBEANSTALK_APPLICATION_DESCRIPTION

Resource Types: AWS::ElasticBeanstalk::Application

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elasticbeanstalk-application-version-description

Checks if AWS Elastic Beanstalk application versions have a description. The rule is NON_COMPLIANT if configuration.description does not exist or is an empty string.

Identifier: ELASTICBEANSTALK_APPLICATION_VERSION_DESCRIPTION

Resource Types: AWS::ElasticBeanstalk::ApplicationVersion

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elasticbeanstalk-environment-description

Checks if AWS Elastic Beanstalk environments have a description. The rule is NON_COMPLIANT if configuration.description does not exist or is an empty string.

Identifier: ELASTICBEANSTALK_ENVIRONMENT_DESCRIPTION

Resource Types: AWS::ElasticBeanstalk::Environment

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elasticsearch-encrypted-at-rest

Checks if Amazon OpenSearch Service (previously called Elasticsearch) domains have encryption at rest configuration enabled. The rule is NON_COMPLIANT if the EncryptionAtRestOptions field is not enabled.

Identifier: ELASTICSEARCH_ENCRYPTED_AT_REST

Resource Types: AWS::Elasticsearch::Domain

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elasticsearch-in-vpc-only

Checks if Amazon OpenSearch Service (previously called Elasticsearch) domains are in Amazon Virtual Private Cloud (Amazon VPC). The rule is NON_COMPLIANT if an OpenSearch Service domain endpoint is public.

Identifier: ELASTICSEARCH_IN_VPC_ONLY

Resource Types: AWS::Elasticsearch::Domain

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elasticsearch-logs-to-cloudwatch

Checks if OpenSearch Service (previously called Elasticsearch) domains are configured to send logs to CloudWatch Logs. The rule is COMPLIANT if a log is enabled for an OpenSearch Service domain. The rule is NON_COMPLIANT if logging is not configured.

Identifier: ELASTICSEARCH_LOGS_TO_CLOUDWATCH

Resource Types: AWS::Elasticsearch::Domain

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

logTypes (Optional), Type: CSV

Comma-separated list of logs that are enabled. Valid values are 'search', 'index', 'error'

Proactive Evaluation

For steps on how to run this rule in proactive mode, see Evaluating Your Resources with AWS Config Rules. For this rule to return COMPLIANT in proactive mode, the resource configuration schema for the StartResourceEvaluation API needs to include the following inputs, encoded as a string:

```
"ResourceConfiguration":
...
{
   "LogPublishingOptions": "{Key : Value, ...}"*
}
...
```

*An object with one or more of the following keys: `SEARCH_SLOW_LOGS`, `ES_APPLICATION_LOGS`, `INDEX_SLOW_LOGS`, `AUDIT_LOGS`, depending on the types of logs you want to publish. Each key needs a valid `LogPublishingOption` value.

For more information on proactive evaluation, see Evaluation Mode.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elasticsearch-node-to-node-encryption-check

Check that Amazon OpenSearch Service nodes are encrypted end to end. The rule is NON_COMPLIANT if the node-to-node encryption is disabled on the domain.

Identifier: ELASTICSEARCH_NODE_TO_NODE_ENCRYPTION_CHECK

Resource Types: AWS::Elasticsearch::Domain

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

Proactive Evaluation

For steps on how to run this rule in proactive mode, see Evaluating Your Resources with AWS Config Rules. For this rule to return COMPLIANT in proactive mode, the resource configuration schema for the StartResourceEvaluation API needs to include the following inputs, encoded as a string:

```
"ResourceConfiguration":
...
{
   "NodeToNodeEncryptionOptions": BOOLEAN
}
...
```

For more information on proactive evaluation, see Evaluation Mode.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elastic-beanstalk-logs-to-cloudwatch

Checks if AWS Elastic Beanstalk environments are configured to send logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if the value of `StreamLogs` is false.

Identifier: ELASTIC_BEANSTALK_LOGS_TO_CLOUDWATCH

Resource Types: AWS::ElasticBeanstalk::Environment

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

DeleteOnTerminate (Optional), Type: String

Checks if logs are configured to be deleted upon termination of the environment. Valid values are `true` or `false`. The rule is NON_COMPLIANT if the value of `logs.DeleteOnTerminate` does not match this parameter.

RetentionInDays (Optional), Type: String

Checks the number of days to keep log events before they expire. Valid values are: 1, 3, 5, 7, 14, 30, 60, 90, 120, 150, 180, 365, 400, 545, 731, 1827, 3653. The rule is NON_COMPLIANT if the value of `logs.RetentionInDays` does not match this parameter.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elastic-beanstalk-managed-updates-enabled

Checks if managed platform updates in an AWS Elastic Beanstalk environment is enabled. The rule is COMPLIANT if the value for `ManagedActionsEnabled` is set to true. The rule is NON_COMPLIANT if the value for `ManagedActionsEnabled` is set to false, or if a parameter is provided and its value does not match the existing configurations.

Identifier: ELASTIC_BEANSTALK_MANAGED_UPDATES_ENABLED

Resource Types: AWS::ElasticBeanstalk::Environment

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei) Region

Parameters:

UpdateLevel (Optional), Type: String

Indicates whether update levels are set to 'minor' version updates or a 'patch' version updates.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elbv2-acm-certificate-required

Checks if Application Load Balancers and Network Load Balancers have listeners that are configured to use certificates from AWS Certificate Manager (ACM). This rule is NON_COMPLIANT if at least 1 load balancer has at least 1 listener that is configured without a certificate from ACM or is configured with a certificate different from an ACM certificate.

Identifier: ELBV2_ACM_CERTIFICATE_REQUIRED

Resource Types: AWS::ElasticLoadBalancingV2::LoadBalancer

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific

(Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

AcmCertificatesAllowed (Optional), Type: CSV

Comma-separated list of certificate Amazon Resource Names (ARNs).

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elbv2-listener-encryption-in-transit

Checks if listeners for the load balancers are configured with HTTPS or TLS termination. The rule is NON_COMPLIANT if listeners are not configured with HTTPS or TLS termination.

Identifier: ELBV2_LISTENER_ENCRYPTION_IN_TRANSIT

Resource Types: AWS::ElasticLoadBalancingV2::Listener

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elbv2-multiple-az

Checks if an Elastic Load Balancer V2 (Application, Network, or Gateway Load Balancer) is mapped to multiple Availability Zones (AZs). The rule is NON_COMPLIANT if an Elastic Load Balancer V2 is

mapped to less than 2 AZs. For more information, see Availability Zones for your Application Load Balancer.

Identifier: ELBV2_MULTIPLE_AZ

Resource Types: AWS::ElasticLoadBalancingV2::LoadBalancer

Trigger type: Configuration changes

AWS Region: All supported AWS regions except AWS GovCloud (US-East), AWS GovCloud (US-West) Region

Parameters:

minAvailabilityZones (Optional), Type: int

Minimum number of expected AZs (between 2 and 10 inclusive).

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elbv2-predefined-security-policy-ssl-check

Checks if listeners for Application Load Balancers (ALBs) or Network Load Balancers (NLBs) use certain security policies. The rule is NON_COMPLIANT if an HTTPS listener for an ALB or a TLS listener for a NLB does not use the security policies you specify.

Identifier: ELBV2_PREDEFINED_SECURITY_POLICY_SSL_CHECK

Resource Types: AWS::ElasticLoadBalancingV2::Listener

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

sslPolicies, Type: CSV

Comma-separated list of SSL security policies for the rule to check. For example, "ELBSecurityPolicy-TLS13-1-2-2021-06".

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elbv2-targetgroup-healthcheck-protocol-encrypted

Checks the target groups for load balancers healthchecks use an encrypted transport protocol. The rule is NON_COMPLIANT if configuration.healthCheckProtocol is not HTTPS. Lambda target types are not applicable.

Identifier: ELBV2_TARGETGROUP_HEALTHCHECK_PROTOCOL_ENCRYPTED

Resource Types: AWS::ElasticLoadBalancingV2::TargetGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elbv2-targetgroup-protocol-encrypted

Checks the target groups for application and network load balancers use an encrypted transport protocol. The rule is NON_COMPLIANT if configuration.protocol is not HTTPS, TLS, or QUIC. Lambda and ALB target types are not applicable.

Identifier: ELBV2_TARGETGROUP_PROTOCOL_ENCRYPTED

Resource Types: AWS::ElasticLoadBalancingV2::TargetGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elb-acm-certificate-required

Checks if the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. This rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.

Identifier: ELB_ACM_CERTIFICATE_REQUIRED

Resource Types: AWS::ElasticLoadBalancing::LoadBalancer

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Africa (Cape Town), Asia Pacific (Osaka), Europe (Milan), Israel (Tel Aviv), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elb-cross-zone-load-balancing-enabled

Checks if cross-zone load balancing is enabled for Classic Load Balancers. The rule is NON_COMPLIANT if cross-zone load balancing is not enabled for Classic Load Balancers.

Identifier: ELB_CROSS_ZONE_LOAD_BALANCING_ENABLED

Resource Types: AWS::ElasticLoadBalancing::LoadBalancer

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elb-custom-security-policy-ssl-check

Checks whether your Classic Load Balancer SSL listeners are using a custom policy. The rule is only applicable if there are SSL listeners for the Classic Load Balancer.

Identifier: ELB_CUSTOM_SECURITY_POLICY_SSL_CHECK

Resource Types: AWS::ElasticLoadBalancing::LoadBalancer

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

sslProtocolsAndCiphers, Type: String

Comma separated list of ciphers and protocols.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elb-deletion-protection-enabled

Checks whether an Elastic Load Balancer has deletion protection enabled. The rule is NON_COMPLIANT if deletion_protection.enabled is false.

Identifier: ELB_DELETION_PROTECTION_ENABLED

Resource Types: AWS::ElasticLoadBalancingV2::LoadBalancer

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elb-internal-scheme-check

Checks if a Classic Load Balancer scheme is internal. The rule is NON_COMPLIANT if configuration.scheme is not set to internal.

Identifier: ELB_INTERNAL_SCHEME_CHECK

Resource Types: AWS::ElasticLoadBalancing::LoadBalancer

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elb-logging-enabled

Checks if the Application Load Balancer and the Classic Load Balancer have logging enabled. The rule is NON_COMPLIANT if the `access_logs.s3.enabled` is false or `access_logs.S3.bucket` is not equal to the s3BucketName that you provided.

> **Note**
>
> The rule does not apply to Network Load Balancers or Gateway Load Balancers.

Identifier: ELB_LOGGING_ENABLED

Resource Types: AWS::ElasticLoadBalancing::LoadBalancer, AWS::ElasticLoadBalancingV2::LoadBalancer

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

s3BucketNames (Optional), Type: CSV

Comma-separated list of Amazon S3 bucket names for Amazon ELB to deliver the log files.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elb-predefined-security-policy-ssl-check

Checks if your Classic Load Balancer SSL listeners use a predefined policy. The rule is NON_COMPLIANT if the Classic Load Balancer HTTPS/SSL listener's policy does not equal the value of the parameter '`predefinedPolicyName`'.

Identifier: ELB_PREDEFINED_SECURITY_POLICY_SSL_CHECK

Resource Types: AWS::ElasticLoadBalancing::LoadBalancer

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

predefinedPolicyName, Type: String

Name of the predefined policy.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elb-tagged

Checks if Classic Load Balancers have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: ELB_TAGGED

Resource Types: AWS::ElasticLoadBalancing::LoadBalancer

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

elb-tls-https-listeners-only

Checks if your Classic Load Balancer is configured with SSL or HTTPS listeners. The rule is NON_COMPLIANT if a listener is not configured with SSL or HTTPS.

- If the Classic Load Balancer does not have a listener configured, then the rule returns `NOT_APPLICABLE`.
- The rule is COMPLIANT if the Classic Load Balancer listeners are configured with SSL or HTTPS.
- The rule is NON_COMPLIANT if a listener is not configured with SSL or HTTPS.

Identifier: ELB_TLS_HTTPS_LISTENERS_ONLY

Resource Types: AWS::ElasticLoadBalancing::LoadBalancer

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

emr-block-public-access

Checks if an account with Amazon EMR has block public access settings enabled. The rule is NON_COMPLIANT if BlockPublicSecurityGroupRules is false, or if true, ports other than Port 22 are listed in PermittedPublicSecurityGroupRuleRanges.

Identifier: EMR_BLOCK_PUBLIC_ACCESS

Resource Types: AWS::::Account

Trigger type: Periodic

AWS Region: All supported AWS regions except China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

emr-kerberos-enabled

Checks if Amazon EMR clusters have Kerberos enabled. The rule is NON_COMPLIANT if a security configuration is not attached to the cluster or the security configuration does not satisfy the specified rule parameters.

Identifier: EMR_KERBEROS_ENABLED

Resource Types: AWS::EMR::Cluster

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

AdminServer (Optional), Type: String

Fully qualified domain of the admin server in the other realm of the trust relationship.

Domain (Optional), Type: String

Domain name of the other realm in the trust relationship.

KdcServer (Optional), Type: String

Fully qualified domain of the KDC server in the other realm of the trust relationship.

Realm (Optional), Type: String

Kereberos realm name of the other realm in the trust relationship.

TicketLifetimeInHours (Optional), Type: int

Period for which Kerberos ticket issued by cluster's KDC is valid.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

emr-master-no-public-ip

Checks if Amazon EMR clusters' master nodes have public IPs. The rule is NON_COMPLIANT if the master node has a public IP.

> **Note**
>
> This rule checks clusters that are in RUNNING or WAITING state. This rule requires you to enable recording for the `AWS::EC2::Instance` resource type in order to have an accurate evaluation.

Identifier: EMR_MASTER_NO_PUBLIC_IP

Resource Types: AWS::EMR::Cluster, AWS::EC2::Instance

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

emr-security-configuration-encryption-rest

Checks if an Amazon EMR security configuration has encryption at rest enabled. The rule is NON_COMPLIANT if configuration.SecurityConfiguration.EncryptionConfiguration.EnableAtRestEncryption is false.

Identifier: EMR_SECURITY_CONFIGURATION_ENCRYPTION_REST

Resource Types: AWS::EMR::SecurityConfiguration

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

emr-security-configuration-encryption-transit

Checks if an Amazon EMR security configuration has encryption in transit enabled. The rule is NON_COMPLIANT if configuration.SecurityConfiguration.EncryptionConfiguration.EnableInTransitEncryption is false.

Identifier: EMR_SECURITY_CONFIGURATION_ENCRYPTION_TRANSIT

Resource Types: AWS::EMR::SecurityConfiguration

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

encrypted-volumes

Checks if attached Amazon EBS volumes are encrypted and optionally are encrypted with a specified KMS key. The rule is NON_COMPLIANT if attached EBS volumes are unencrypted or are encrypted with a KMS key not in the supplied parameters.

Identifier: ENCRYPTED_VOLUMES

Resource Types: AWS::EC2::Volume

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

kmsId (Optional), Type: String

ID or ARN of the KMS key that is used to encrypt the volume.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

eventschemas-discoverer-tagged

Checks if AWS EventSchemas discoverer resources have tags. Optionally, required tag keys can be specified. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not consider tags starting with `aws:`.

Identifier: EVENTSCHEMAS_DISCOVERER_TAGGED

Resource Types: AWS::EventSchemas::Discoverer

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with `aws:` are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

eventschemas-registry-tagged

Checks if Amazon EventBridge Schema Registry resources have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EVENTSCHEMAS_REGISTRY_TAGGED

Resource Types: AWS::EventSchemas::Registry

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

event-data-store-cmk-encryption-enabled

Checks if AWS Cloud Trail event data stores have customer managed AWS KMS keys enabled. The rule is NON_COMPLIANT if an event data store has disabled customer managed KMS keys. Optionally, you can specify a list of KMS keys for the rule to check.

Identifier: EVENT_DATA_STORE_CMK_ENCRYPTION_ENABLED

Resource Types: AWS::CloudTrail::EventDataStore

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

kmsKeyArns (Optional), Type: CSV

> Comma-separated list of Amazon Resource Names (ARNs) of AWS KMS keys for the rule to check. If provided, the rule is NON_COMPLIANT if an AWS Cloud Trail event data store is not encrypted with one of these KMS keys.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

evidently-launch-description

Checks if Amazon CloudWatch Evidently launches have a description. The rule is NON_COMPLIANT if configuration.Description does not exist or is an empty string.

Identifier: EVIDENTLY_LAUNCH_DESCRIPTION

Resource Types: AWS::Evidently::Launch

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

evidently-launch-tagged

Checks if Amazon CloudWatch Evidently launches have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EVIDENTLY_LAUNCH_TAGGED

Resource Types: AWS::Evidently::Launch

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

evidently-project-description

Checks if Amazon CloudWatch Evidently projects have a description. The rule is NON_COMPLIANT if configuration.Description does not exist or is an empty string.

Identifier: EVIDENTLY_PROJECT_DESCRIPTION

Resource Types: AWS::Evidently::Project

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

evidently-project-tagged

Checks if Amazon CloudWatch Evidently projects have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EVIDENTLY_PROJECT_TAGGED

Resource Types: AWS::Evidently::Project

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

evidently-segment-description

Checks if Amazon CloudWatch Evidently segments have a description. The rule is NON_COMPLIANT if configuration.Description does not exist or is an empty string.

Identifier: EVIDENTLY_SEGMENT_DESCRIPTION

Resource Types: AWS::Evidently::Segment

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

evidently-segment-tagged

Checks if Amazon CloudWatch Evidently segments have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: EVIDENTLY_SEGMENT_TAGGED

Resource Types: AWS::Evidently::Segment

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

fis-experiment-template-log-configuration-exists

Checks if AWS FIS experiment templates have experiment logging configured. The rule is NON_COMPLIANT if configuration.LogConfiguration does not exist.

Identifier: FIS_EXPERIMENT_TEMPLATE_LOG_CONFIGURATION_EXISTS

Resource Types: AWS::FIS::ExperimentTemplate

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

fis-experiment-template-tagged

Checks if AWS FIS experiment templates have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: FIS_EXPERIMENT_TEMPLATE_TAGGED

Resource Types: AWS::FIS::ExperimentTemplate

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud

(US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

fms-shield-resource-policy-check

> **Note**
>
> This rule is currently in the deprecation process. We do not recommend that you use them directly.

Checks if resources that AWS Shield Advanced can protect are protected by Shield Advanced. The rule is NON_COMPLIANT if a specified resource is not protected.

Identifier: FMS_SHIELD_RESOURCE_POLICY_CHECK

Resource Types: AWS::CloudFront::Distribution, AWS::ElasticLoadBalancingV2::LoadBalancer, AWS::WAFRegional::WebACL, AWS::EC2::EIP, AWS::ElasticLoadBalancing::LoadBalancer, AWS::ShieldRegional::Protection, AWS::Shield::Protection

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

resourceTypes, Type: String

The resource scope which this config rule will be applied to.

webACLId, Type: String

The WebACLId of the web ACL.

excludeResourceTags (Optional), Type: boolean

If true, exclude the resources that match the resourceTags. If false, include all the resources that match the resourceTags.

fmsManagedToken (Optional), Type: String

A token generated by AWS Firewall Manager when creating the rule in your account. AWS Config ignores this parameter when you create this rule.

fmsRemediationEnabled (Optional), Type: boolean

If true, AWS Firewall Manager will update NON_COMPLIANT resources according to FMS policy. AWS Config ignores this parameter when you create this rule.

resourceTags (Optional), Type: String

The resource tags that the rule should be associated with (for example, { "tagKey1" : ["tagValue1"], "tagKey2" : ["tagValue2", "tagValue3"] }).

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

fms-webacl-resource-policy-check

> **Note**
>
> This rule is currently in the deprecation process. We do not recommend that you use them directly.

Checks if the web ACL is associated with an Application Load Balancer, API Gateway stage, or Amazon CloudFront distributions. When AWS Firewall Manager creates this rule, the FMS policy owner specifies the `WebACLId` in the FMS policy and can optionally enable remediation.

Identifier: FMS_WEBACL_RESOURCE_POLICY_CHECK

Resource Types: AWS::CloudFront::Distribution, AWS::ApiGateway::Stage, AWS::ElasticLoadBalancingV2::LoadBalancer, AWS::WAFRegional::WebACL

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

webACLId, Type: String

The WebACLId of the web ACL.

excludeResourceTags (Optional), Type: boolean

If true, exclude resources that match resourceTags.

fmsManagedToken (Optional), Type: String

A token generated by AWS Firewall Manager when creating the rule in customer account. AWS Config ignores this parameter when customer creates this rule.

fmsRemediationEnabled (Optional), Type: boolean

If true, AWS Firewall Manager will update non-compliant resources according to FMS policy. AWS Config ignores this parameter when customer creates this rule.

resourceTags (Optional), Type: String

The resource tags (ApplicationLoadBalancer, ApiGatewayStage and CloudFront distributions) that the rule should be associated with. (for example, { "tagKey1" : ["tagValue1"], "tagKey2" : ["tagValue2", "tagValue3"] })

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

fms-webacl-rulegroup-association-check

> **Note**
>
> This rule is currently in the deprecation process. We do not recommend that you use them directly.

Checks if the rule groups associate with the web ACL at the correct priority. The correct priority is decided by the rank of the rule groups in the ruleGroups parameter. When AWS Firewall Manager creates this rule, it assigns the highest priority 0 followed by 1, 2, and so on. The FMS policy owner specifies the `ruleGroups` rank in the FMS policy and can optionally enable remediation.

Identifier: FMS_WEBACL_RULEGROUP_ASSOCIATION_CHECK

Resource Types: AWS::WAF::WebACL, AWS::WAFRegional::WebACL

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

ruleGroups, Type: String

Comma-separated list of RuleGroupIds and WafOverrideAction pairs. (for example, ruleGroupId-1:NONE, ruleGroupId2:COUNT)

fmsManagedToken (Optional), Type: String

A token generated by AWS Firewall Manager when creating the rule in customer account. AWS Config ignores this parameter when customer creates this rule.

fmsRemediationEnabled (Optional), Type: boolean

If true, AWS Firewall Manager will update non-compliant resources according to FMS policy. AWS Config ignores this parameter when customer creates this rule.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

frauddetector-entity-type-tagged

Checks if Amazon Fraud Detector entity types have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: FRAUDDETECTOR_ENTITY_TYPE_TAGGED

Resource Types: AWS::FraudDetector::EntityType

Trigger type: Configuration changes

AWS Region: Only available in US East (Ohio), Europe (Ireland), US East (N. Virginia), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

frauddetector-label-tagged

Checks if Amazon Fraud Detector labels have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: FRAUDDETECTOR_LABEL_TAGGED

Resource Types: AWS::FraudDetector::Label

Trigger type: Configuration changes

AWS Region: Only available in US East (Ohio), Europe (Ireland), US East (N. Virginia), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

frauddetector-outcome-tagged

Checks if Amazon Fraud Detector outcomes have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: FRAUDDETECTOR_OUTCOME_TAGGED

Resource Types: AWS::FraudDetector::Outcome

Trigger type: Configuration changes

AWS Region: Only available in US East (Ohio), Europe (Ireland), US East (N. Virginia), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

frauddetector-variable-tagged

Checks if Amazon Fraud Detector variables have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: FRAUDDETECTOR_VARIABLE_TAGGED

Resource Types: AWS::FraudDetector::Variable

Trigger type: Configuration changes

AWS Region: Only available in US East (Ohio), Europe (Ireland), US East (N. Virginia), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

fsx-last-backup-recovery-point-created

Checks if a recovery point was created for Amazon FSx File Systems. The rule is NON_COMPLIANT if the Amazon FSx File System does not have a corresponding recovery point created within the specified time period.

Identifier: FSX_LAST_BACKUP_RECOVERY_POINT_CREATED

Resource Types: AWS::FSx::FileSystem

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

recoveryPointAgeUnit (Optional), Type: String, Default: days

Unit of time for maximum allowed age. Accepted values: 'hours', 'days'.

recoveryPointAgeValue (Optional), Type: int, Default: 1

Numerical value for maximum allowed age. No more than 744 for hours, 31 for days.

resourceId (Optional), Type: String

ID of Amazon FSx File System for the rule to check.

resourceTags (Optional), Type: String

Tags of Amazon FSx File Systems for the rule to check, in JSON format `{"tagkey" : "tagValue"}`.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

fsx-lustre-copy-tags-to-backups

Checks if the Amazon FSx for Lustre file systems are configured to copy tags to backups. The rule is NON_COMPLIANT if Lustre file systems are not configured to copy tags to backups.

Identifier: FSX_LUSTRE_COPY_TAGS_TO_BACKUPS

Resource Types: AWS::FSx::FileSystem

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

fsx-meets-restore-time-target

Checks if the restore time of Amazon FSx File Systems meets the specified duration. The rule is NON_COMPLIANT if LatestRestoreExecutionTimeMinutes of an Amazon FSx File System is greater than maxRestoreTime minutes.

Identifier: FSX_MEETS_RESTORE_TIME_TARGET

Resource Types: AWS::FSx::FileSystem

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

maxRestoreTime, Type: int

Numerical value for the maximum allowed restore runtime.

resourceId (Optional), Type: String

ID of Amazon FSx File System for the rule to check.

resourceTags (Optional), Type: String

Tags of Amazon FSx File Systems for the rule to check, in JSON format.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

fsx-ontap-deployment-type-check

Checks if Amazon FSx for NetApp ONTAP file systems are configured with certain deployment types. The rule is NON_COMPLIANT if the Amazon FSx for NetApp ONTAP file systems are not configured with the deployment types you specify.

Identifier: FSX_ONTAP_DEPLOYMENT_TYPE_CHECK

Resource Types: AWS::FSx::FileSystem

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Canada West (Calgary) Region

Parameters:

deploymentTypes, Type: CSV

Comma-separated list of allowed Deployment types for the rule to check.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

fsx-openzfs-copy-tags-enabled

Checks if the Amazon FSx for OpenZFS file systems are configured to copy tags to backups and volumes. The rule is NON_COMPLIANT if FSx for OpenZFS file systems are not configured to copy tags to backups and volumes.

Identifier: FSX_OPENZFS_COPY_TAGS_ENABLED

Resource Types: AWS::FSx::FileSystem

Trigger type: Periodic

AWS Region: All supported AWS regions except China (Beijing), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

fsx-openzfs-deployment-type-check

Checks if the Amazon FSx for OpenZFS file systems are configured with certain deployment types. The rule is NON_COMPLIANT if FSx for OpenZFS file systems are not configured with the deployment types you specify.

Identifier: FSX_OPENZFS_DEPLOYMENT_TYPE_CHECK

Resource Types: AWS::FSx::FileSystem

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (Melbourne), Canada West (Calgary) Region

Parameters:

deploymentTypes, Type: CSV

Comma-separated list of allowed Deployment types for the rule to check.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

fsx-resources-protected-by-backup-plan

Checks if Amazon FSx File Systems are protected by a backup plan. The rule is NON_COMPLIANT if the Amazon FSx File System is not covered by a backup plan.

Identifier: FSX_RESOURCES_PROTECTED_BY_BACKUP_PLAN

Resource Types: AWS::FSx::FileSystem

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

backupVaultLockCheck (Optional), Type: String

Accepted values: 'True' or 'False'. Enter 'True' for the rule to check if the resource is backed up in a locked vault

crossAccountList (Optional), Type: String

Comma-separated list of destination accounts for cross-account backup copy to be kept

crossRegionList (Optional), Type: String

Comma-separated list of destination regions for the cross-region backup copy to be kept

maxRetentionDays (Optional), Type: int

The maximum retention period in days for the Backup Vault Lock

minRetentionDays (Optional), Type: int

The minimum retention period in days for the Backup Vault Lock

resourceId (Optional), Type: String

ID of the Amazon FSx File System for the rule to check.

resourceTags (Optional), Type: String

Tags of Amazon FSx File Systems for the rule to check, in JSON format `{"tagkey" : "tagValue"}`.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

fsx-windows-audit-log-configured

Checks if the Amazon FSx for Windows File Server file systems have file access auditing enabled. The rule is NON_COMPLIANT if the FSx for Windows File Server file systems do not have file access auditing enabled.

Identifier: FSX_WINDOWS_AUDIT_LOG_CONFIGURED

Resource Types: AWS::FSx::FileSystem

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

fsx-windows-deployment-type-check

Checks if the Amazon FSx for WINDOWS file systems are configured with certain deployment types. The rule is NON_COMPLIANT if FSx for WINDOWS file systems are not configured with the deployment types you specify.

Identifier: FSX_WINDOWS_DEPLOYMENT_TYPE_CHECK

Resource Types: AWS::FSx::FileSystem

Trigger type: Periodic

AWS Region: All supported AWS regions except Canada West (Calgary) Region

Parameters:

deploymentTypes, Type: CSV

Comma-separated list of allowed Deployment types for the rule to check.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

glb-listener-tagged

Checks if Gateway Load Balancer listeners have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: GLB_LISTENER_TAGGED

Resource Types: AWS::ElasticLoadBalancingV2::Listener

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

glb-tagged

Checks if Gateway Load Balancers have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: GLB_TAGGED

Resource Types: AWS::ElasticLoadBalancingV2::LoadBalancer

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

global-endpoint-event-replication-enabled

Checks if event replication is enabled for Amazon EventBridge global endpoints. The rule is NON_COMPLIANT if event replication is not enabled.

Identifier: GLOBAL_ENDPOINT_EVENT_REPLICATION_ENABLED

Resource Types: AWS::Events::Endpoint

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Osaka), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

glue-job-logging-enabled

Checks if an AWS Glue job has logging enabled. The rule is NON_COMPLIANT if an AWS Glue job does not have Amazon CloudWatch logs enabled.

Identifier: GLUE_JOB_LOGGING_ENABLED

Resource Types: AWS::Glue::Job

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

glue-ml-transform-encrypted-at-rest

Checks if an AWS Glue ML Transform has encryption at rest enabled. The rule is NON_COMPLIANT if `MLUserDataEncryptionMode` is set to `DISABLED`.

Identifier: GLUE_ML_TRANSFORM_ENCRYPTED_AT_REST

Resource Types: AWS::Glue::MLTransform

Trigger type: Configuration changes

AWS Region: All supported AWS regions except AWS GovCloud (US-East), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

glue-ml-transform-tagged

Checks if AWS Glue machine learning transforms have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: GLUE_ML_TRANSFORM_TAGGED

Resource Types: AWS::Glue::MLTransform

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

glue-spark-job-supported-version

Checks if an AWS Glue Spark job is running on the specified minimum supported AWS Glue version. The rule is NON_COMPLIANT if the AWS Glue Spark job is not running on the minimum supported AWS Glue version that you specify.

Identifier: GLUE_SPARK_JOB_SUPPORTED_VERSION

Resource Types: AWS::Glue::Job

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

minimumSupportedGlueVersion, Type: String

String value you must specify of the minimum supported AWS Glue version for the rule to check.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

groundstation-config-tagged

Checks if AWS GroundStation config resources resources have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: GROUNDSTATION_CONFIG_TAGGED

Resource Types: AWS::GroundStation::Config

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Middle East (Bahrain), US East (Ohio), Africa (Cape Town), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Asia Pacific (Seoul), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

groundstation-dataflowendpointgroup-tagged

Checks if AWS GroundStation dataflow endpoint group resources have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule doesn't check tags starting with 'aws:'.

Identifier: GROUNDSTATION_DATAFLOWENDPOINTGROUP_TAGGED

Resource Types: AWS::GroundStation::DataflowEndpointGroup

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Middle East (Bahrain), US East (Ohio), Africa (Cape Town), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Asia Pacific (Seoul), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

groundstation-missionprofile-tagged

Checks if AWS GroundStation mission profile resources have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: GROUNDSTATION_MISSIONPROFILE_TAGGED

Resource Types: AWS::GroundStation::MissionProfile

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Middle East (Bahrain), US East (Ohio), Africa (Cape Town), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Asia Pacific (Seoul), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

guardduty-ec2-protection-runtime-enabled

Checks if EC2 Runtime Monitoring with automated agent management is enabled for Amazon GuardDuty detector. The rule is NON_COMPLIANT if the feature is not enabled for your account or at least one member account in your organization.

Identifier: GUARDDUTY_EC2_PROTECTION_RUNTIME_ENABLED

Resource Types: AWS::GuardDuty::Detector

Trigger type: Periodic

AWS Region: All supported AWS regions except China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

guardduty-ecs-protection-runtime-enabled

Checks if ECS Runtime Monitoring with automated agent management is enabled for Amazon GuardDuty detector. The rule is NON_COMPLIANT if the feature is not enabled for your account or at least one member account in your organization.

Identifier: GUARDDUTY_ECS_PROTECTION_RUNTIME_ENABLED

Resource Types: AWS::GuardDuty::Detector

Trigger type: Periodic

AWS Region: All supported AWS regions except China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

guardduty-eks-protection-audit-enabled

Checks if Audit Log Monitoring for Amazon Elastic Kubernetes Service (Amazon EKS) is enabled for an Amazon GuardDuty detector in your account. The rule is NON_COMPLIANT if the EKS Audit Log Monitoring feature is not enabled for your account.

Identifier: GUARDDUTY_EKS_PROTECTION_AUDIT_ENABLED

Resource Types: AWS::GuardDuty::Detector

Trigger type: Periodic

AWS Region: All supported AWS regions except China (Beijing), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

guardduty-eks-protection-runtime-enabled

Checks if Amazon EKS Runtime Monitoring with automated agent management is enabled for GuardDuty detector in your account. The rule is NON_COMPLIANT if EKS Runtime Monitoring with automated agent management in GuardDuty is not enabled for your account.

Identifier: GUARDDUTY_EKS_PROTECTION_RUNTIME_ENABLED

Resource Types: AWS::GuardDuty::Detector

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

guardduty-enabled-centralized

Checks if Amazon GuardDuty is enabled in your AWS account and AWS Region. If you provide an AWS account for centralization, the rule evaluates the GuardDuty results in the centralized account. The rule is COMPLIANT when GuardDuty is enabled.

Identifier: GUARDDUTY_ENABLED_CENTRALIZED

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Mexico (Central), Asia Pacific (Taipei) Region

Parameters:

CentralMonitoringAccount (Optional), Type: String

> Comma separated list of AWS Accounts (12-digit) where Amazon GuardDuty results are allowed to be centralized.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

guardduty-lambda-protection-enabled

Checks if Lambda Protection is enabled for an Amazon GuardDuty detector in your account. The rule is NON_COMPLIANT if the Lambda Protection feature in Amazon GuardDuty is not enabled for your account.

Identifier: GUARDDUTY_LAMBDA_PROTECTION_ENABLED

Resource Types: AWS::GuardDuty::Detector

Trigger type: Periodic

AWS Region: All supported AWS regions except China (Beijing), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

guardduty-malware-protection-enabled

Checks if Malware Protection is enabled for an Amazon GuardDuty detector in your account. The rule is NON_COMPLIANT if the Malware Protection feature in Amazon GuardDuty is not enabled for your account.

Identifier: GUARDDUTY_MALWARE_PROTECTION_ENABLED

Resource Types: AWS::GuardDuty::Detector

Trigger type: Periodic

AWS Region: All supported AWS regions except China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

guardduty-non-archived-findings

Checks if Amazon GuardDuty has findings that are non-archived. The rule is NON_COMPLIANT if GuardDuty has non-archived low/medium/high severity findings older than the specified number in the daysLowSev/`daysMediumSev`/daysHighSev parameter.

Identifier: GUARDDUTY_NON_ARCHIVED_FINDINGS

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Mexico (Central), Asia Pacific (Taipei) Region

Parameters:

daysHighSev (Optional), Type: int, Default: 1

The number of days Amazon GuardDuty high severity findings are allowed to stay non archived. The default is 1 day.

daysLowSev (Optional), Type: int, Default: 30

The number of days Amazon GuardDuty low severity findings are allowed to stay non archived. The default is 30 days.

daysMediumSev (Optional), Type: int, Default: 7

The number of days Amazon GuardDuty medium severity findings are allowed to stay non archived. The default is 7 days.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

guardduty-rds-protection-enabled

Checks if Amazon Relational Database Service (Amazon RDS) protection is enabled for an Amazon GuardDuty detector in your account. The rule is NON_COMPLIANT if the Amazon RDS protection feature in Amazon GuardDuty is not enabled for you account.

Identifier: GUARDDUTY_RDS_PROTECTION_ENABLED

Resource Types: AWS::GuardDuty::Detector

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

guardduty-runtime-monitoring-enabled

Checks if Runtime Monitoring is enabled for Amazon GuardDuty detector in your account or organization. The rule is NON_COMPLIANT if Runtime Monitoring in GuardDuty is not enabled for your account or at least one member account in your organization.

Identifier: GUARDDUTY_RUNTIME_MONITORING_ENABLED

Resource Types: AWS::GuardDuty::Detector

Trigger type: Periodic

AWS Region: All supported AWS regions except China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

guardduty-s3-protection-enabled

Checks if S3 Protection is enabled for an Amazon GuardDuty Detector in your account. The rule is NON_COMPLIANT if the S3 Protection feature in Amazon GuardDuty is not enabled for your account.

Identifier: GUARDDUTY_S3_PROTECTION_ENABLED

Resource Types: AWS::GuardDuty::Detector

Trigger type: Periodic

AWS Region: All supported AWS regions except China (Beijing), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

healthlake-fhirdatastore-tagged

Checks if Amazon HealthLake FHIRDatastores have tags. Optionally, required tag keys can be specified. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not consider tags starting with `aws:`.

Identifier: HEALTHLAKE_FHIRDATASTORE_TAGGED

Resource Types: AWS::HealthLake::FHIRDatastore

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), US East (Ohio), US East (N. Virginia), US West (Oregon) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iam-customer-policy-blocked-kms-actions

Checks if the managed AWS Identity and Access Management (IAM) policies that you create do not allow blocked actions on AWS KMS keys. The rule is NON_COMPLIANT if any blocked action is allowed on AWS KMS keys by the managed IAM policy.

> **Note**
>
> To be considered non-public, an IAM policy must grant access only to fixed values. This means values that don't contain a wildcard or the following IAM policy element: Variables.

> **Note**
>
> If a single value in an IAM customer managed policy (for example, one Resource or Condition value) contains more than five IAM policy variables, the rule can't evaluate that policy and returns NON_COMPLIANT, even if the policy would otherwise be compliant. To get an accurate evaluation, split any value that contains more than five policy variables so that each value contains five or fewer.

Identifier: IAM_CUSTOMER_POLICY_BLOCKED_KMS_ACTIONS

Resource Types: AWS::IAM::Policy

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico

(Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

blockedActionsPatterns, Type: CSV

Comma-separated list of blocked KMS action patterns. For example, you can list kms:Decrypt* or kms:ReEncrypt as blocked action patterns. The rule is NON_COMPLIANT if the managed IAM policy allows any action pattern listed in this parameter.

excludePermissionBoundaryPolicy (Optional), Type: boolean

Boolean flag to exclude the evaluation of IAM policies used as permissions boundaries. If set to 'true', the rule will not include permissions boundaries in the evaluation. Otherwise, all IAM policies in scope are evaluated when value is set to 'false.' Default value is 'false'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iam-external-access-analyzer-enabled

Checks if an IAM Access Analyzer for external access is activated in your account per region. The rule is NON_COMPLIANT if there are no analyzers for external access in the region or if the 'status' attribute is not set to 'ACTIVE'.

Identifier: IAM_EXTERNAL_ACCESS_ANALYZER_ENABLED

Resource Types: AWS::::Account

Trigger type: Periodic

AWS Region: All supported AWS regions except China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iam-group-has-users-check

Checks whether IAM groups have at least one IAM user.

Identifier: IAM_GROUP_HAS_USERS_CHECK

Resource Types: AWS::IAM::Group

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iam-inline-policy-blocked-kms-actions

Checks if the inline policies attached to your IAM users, roles, and groups do not allow blocked actions on all AWS KMS keys. The rule is NON_COMPLIANT if any blocked action is allowed on all AWS KMS keys in an inline policy.

> **Note**
>
> If a single value in an inline IAM policy (for example, one Resource or Condition value) contains more than five IAM policy variables, the rule can't evaluate that policy and returns NON_COMPLIANT, even if the policy would otherwise be compliant. To get an accurate

evaluation, split any value that contains more than five policy variables so that each value contains five or fewer.
Because all inline policies attached to a user, group, or role are evaluated together, a single inline policy that exceeds this limit causes the rule to return NON_COMPLIANT for that user, group, or role.

Identifier: IAM_INLINE_POLICY_BLOCKED_KMS_ACTIONS

Resource Types: AWS::IAM::Group, AWS::IAM::Role, AWS::IAM::User

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

blockedActionsPatterns, Type: CSV

Comma-separated list of blocked KMS action patterns, for example, kms:*, kms:Decrypt, kms:ReEncrypt*.

excludeRoleByManagementAccount (Optional), Type: boolean

Exclude a role if it is only assumable by organization management account.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iam-no-inline-policy-check

Checks if the inline policy feature is not in use. The rule is NON_COMPLIANT if an AWS Identity and Access Management (IAM) user, IAM role or IAM group has any inline policy.

Identifier: IAM_NO_INLINE_POLICY_CHECK

Resource Types: AWS::IAM::Group, AWS::IAM::Role, AWS::IAM::User

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iam-oidc-provider-client-id-list-check

Checks if AWS IAM OIDC providers are configured with approved client IDs. The rule is NON_COMPLIANT if configuration.ClientIdList contains IDs not specified in the required rule parameter.

Identifier: IAM_OIDC_PROVIDER_CLIENT_ID_LIST_CHECK

Resource Types: AWS::IAM::OIDCProvider

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

allowedClientIds, Type: CSV

Comma-separated list of client IDs for the rule to check. The rule is NON_COMPLIANT if configuration.ClientIdList contains values not specified in this parameter.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iam-oidc-provider-tagged

Checks if AWS IAM OIDC providers have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IAM_OIDC_PROVIDER_TAGGED

Resource Types: AWS::IAM::OIDCProvider

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iam-password-policy

Checks if the account password policy for AWS Identity and Access Management (IAM) users meets the specified requirements indicated in the parameters. The rule is NON_COMPLIANT if the account password policy does not meet the specified requirements.

> **Important**
>
> The `true` and `false` values for the rule parameters are case-sensitive. If `true` is not provided in lowercase, it will be treated as `false`.

> **Note**
>
> **Evaluation Result for the Default IAM Password Policy**
> This rule is marked as NON_COMPLIANT when the default IAM password policy is used.
> **Managed Rules and Global IAM Resource Types**
> The global IAM resource types onboarded before February 2022 (`AWS::IAM::Group`, `AWS::IAM::Policy`, `AWS::IAM::Role`, and `AWS::IAM::User`) can only be recorded by AWS Config in AWS Regions where AWS Config was available before February 2022. These resource types cannot be recorded in Regions supported by AWS Config after February 2022. For a list of those Regions, see Recording AWS Resources | Global Resources.
> If you record a global IAM resource type in at least one Region, periodic rules that report compliance on the global IAM resource type will run evaluations in all Regions where the periodic rule is added, even if you have not enabled the recording of the global IAM resource type in the Region where the periodic rule was added.
> To avoid unnecessary evaluations, you should only deploy periodic rules that report compliance on a global IAM resource type to one of the supported Regions. For a list of which managed rules are supported in which Regions, see List of AWS Config Managed Rules by Region Availability.

Identifier: IAM_PASSWORD_POLICY

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

MaxPasswordAge (Optional), Type: int, Default: 90

Number of days before password expiration.

MinimumPasswordLength (Optional), Type: int, Default: 14

Password minimum length.

PasswordReusePrevention (Optional), Type: int, Default: 24

Number of passwords before allowing reuse.

RequireLowercaseCharacters (Optional), Type: boolean, Default: true

Require at least one lowercase character in password.

RequireNumbers (Optional), Type: boolean, Default: true

Require at least one number in password.

RequireSymbols (Optional), Type: boolean, Default: true

Require at least one symbol in password.

RequireUppercaseCharacters (Optional), Type: boolean, Default: true

Require at least one uppercase character in password.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iam-policy-blacklisted-check

Checks in each AWS Identity and Access Management (IAM) resource, if a policy Amazon Resource Name (ARN) in the input parameter is attached to the IAM resource. The rule is NON_COMPLIANT if the policy ARN is attached to the IAM resource.

Identifier: IAM_POLICY_BLACKLISTED_CHECK

Resource Types: AWS::IAM::User, AWS::IAM::Group, AWS::IAM::Role

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

policyArns, Type: CSV, Default: arn:aws:iam::aws:policy/AdministratorAccess

Comma separated list of IAM policy arns which should not be attached to any IAM entity.

exceptionList (Optional), Type: CSV

Comma separated list of resourcetypes and list of resource name pairs. For example, users: [user1;user2], groups:[group1;group2], roles:[role1;role2;role3].

> **Note**
>
> For the exception list, specify the name of the resource and not the full ARN. Not valid: `arn:aws:iam::444455556666:role/Admin`. Valid: `Admin`.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iam-policy-description

Checks if AWS Identity and Access Management (IAM) Policy description field exists. The rule is NON_COMPLIANT if the description field does not exist or is an empty string.

Identifier: IAM_POLICY_DESCRIPTION

Resource Types: AWS::IAM::Policy

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iam-policy-in-use

Checks whether the IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.

> **Note**
>
> **Managed Rules and Global IAM Resource Types**
>
> The global IAM resource types onboarded before February 2022 (`AWS::IAM::Group`, `AWS::IAM::Policy`, `AWS::IAM::Role`, and `AWS::IAM::User`) can only be recorded by AWS Config in AWS Regions where AWS Config was available before February 2022. These resource types cannot be recorded in Regions supported by AWS Config after February 2022. For a list of those Regions, see Recording AWS Resources | Global Resources.
>
> If you record a global IAM resource type in at least one Region, periodic rules that report compliance on the global IAM resource type will run evaluations in all Regions where the periodic rule is added, even if you have not enabled the recording of the global IAM resource type in the Region where the periodic rule was added.
>
> To avoid unnecessary evaluations, you should only deploy periodic rules that report compliance on a global IAM resource type to one of the supported Regions. For a list of which managed rules are supported in which Regions, see List of AWS Config Managed Rules by Region Availability.

> **Note**
>
> If a single value in an IAM policy (for example, one Resource or Condition value) contains more than five IAM policy variables, the rule can't evaluate that policy and returns NON_COMPLIANT, even if the policy would otherwise be compliant. To get an accurate evaluation, split any value that contains more than five policy variables so that each value contains five or fewer.

Identifier: IAM_POLICY_IN_USE

Resource Types: AWS::::Account

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

policyARN, Type: String

An IAM policy ARN to be checked.

policyUsageType (Optional), Type: String

Specify whether you expect the policy to be attached to an IAM user, group or role. Valid values are IAM_USER, IAM_GROUP, IAM_ROLE, or ANY. Default value is ANY.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iam-policy-no-statements-with-admin-access

Checks if AWS Identity and Access Management (IAM) policies that you create have Allow statements that grant permissions to all actions on all resources. The rule is NON_COMPLIANT if any customer managed IAM policy statement includes "Effect": "Allow" with "Action": "*" over "Resource": "*".

> **Note**
>
> This rule only evaluates customer managed policies. This rule does NOT evaluate inline policies or AWS managed policies. For more information on the difference, see Managed policies and inline policies in the *IAM User Guide*.

The following policy is NON_COMPLIANT:

```
"Statement": [
    {
        "Sid": "VisualEditor",
        "Effect": "Allow",
        "Action": "*",
        "Resource": "*"
    }
]
```

The following policy is COMPLIANT:

```
"Statement": [
    {
        "Sid": "VisualEditor",
        "Effect": "Allow",
        "Action": "service:*",
        "Resource": "*"
    }
]
```

Identifier: IAM_POLICY_NO_STATEMENTS_WITH_ADMIN_ACCESS

Resource Types: AWS::IAM::Policy

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

excludePermissionBoundaryPolicy (Optional), Type: boolean

> Boolean flag to exclude the evaluation of IAM policies used as permissions boundaries. If set to 'true', the rule will not include permissions boundaries in the evaluation. Otherwise, all IAM policies in scope are evaluated when value is set to 'false.' Default value is 'false'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iam-policy-no-statements-with-full-access

Checks if AWS Identity and Access Management (IAM) policies that you create grant permissions to all actions on individual AWS resources. The rule is NON_COMPLIANT if any customer managed IAM policy allows full access to at least 1 AWS service.

Context: Following the principle of least privilege, it is recommended to limit the permitted actions in your IAM policies when granting permissions to AWS services. This approach helps ensure that

you only grant the necessary permissions by specifying the exact actions required, avoiding the use of unrestricted wildcards for a service, such as `ec2:*`.

In some cases, you might want to permit multiple actions with a similar prefix, such as DescribeFlowLogs and DescribeAvailabilityZones. In these cases, you can add a suffixed wildcard to the common prefix (for example, `ec2:Describe*`). Grouping related actions can help avoid hitting IAM policy size limits.

This rule will return COMPLIANT if you use prefixed actions with a suffixed wildcard (for example, `ec2:Describe*`). This rule will only return NON_COMPLIANT if you use unrestricted wildcards (for example, `ec2:*`).

> **Note**
>
> This rule only evaluates customer managed policies. This rule does NOT evaluate inline policies or AWS managed policies. For more information on the difference, see Managed policies and inline policies in the *IAM User Guide*.

Identifier: IAM_POLICY_NO_STATEMENTS_WITH_FULL_ACCESS

Resource Types: AWS::IAM::Policy

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

excludePermissionBoundaryPolicy (Optional), Type: boolean

> Boolean flag to exclude the evaluation of IAM policies used as permissions boundaries. If set to 'true', the rule will not include permissions boundaries in the evaluation. Otherwise, all IAM policies in scope are evaluated when value is set to 'false.' Default value is 'false'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iam-role-managed-policy-check

Checks if all managed policies specified in the list of managed policies are attached to the AWS Identity and Access Management (IAM) role. The rule is NON_COMPLIANT if a managed policy is not attached to the IAM role.

Identifier: IAM_ROLE_MANAGED_POLICY_CHECK

Resource Types: AWS::IAM::Role

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

managedPolicyArns, Type: CSV

> Comma-separated list of AWS managed policy Amazon Resource Names (ARNs). For more information, see Amazon Resource Names (ARNs) and AWS managed policies in the *IAM User Guide*.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iam-root-access-key-check

Checks if the root user access key is available. The rule is COMPLIANT if the user access key does not exist. Otherwise, NON_COMPLIANT.

> **Note**
>
> **Managed Rules and Global IAM Resource Types**
>
> The global IAM resource types onboarded before February 2022 (`AWS::IAM::Group`, `AWS::IAM::Policy`, `AWS::IAM::Role`, and `AWS::IAM::User`) can only be recorded by AWS Config in AWS Regions where AWS Config was available before February 2022. These resource types cannot be recorded in Regions supported by AWS Config after February 2022. For a list of those Regions, see Recording AWS Resources | Global Resources.
>
> If you record a global IAM resource type in at least one Region, periodic rules that report compliance on the global IAM resource type will run evaluations in all Regions where the periodic rule is added, even if you have not enabled the recording of the global IAM resource type in the Region where the periodic rule was added.
>
> To avoid unnecessary evaluations, you should only deploy periodic rules that report compliance on a global IAM resource type to one of the supported Regions. For a list of which managed rules are supported in which Regions, see List of AWS Config Managed Rules by Region Availability.

Identifier: IAM_ROOT_ACCESS_KEY_CHECK

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iam-saml-provider-tagged

Checks if AWS IAM SAML providers have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IAM_SAML_PROVIDER_TAGGED

Resource Types: AWS::IAM::SAMLProvider

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iam-server-certificate-expiration-check

Checks if AWS IAM SSL/TLS server certificates stored in IAM are expired. The rule is NON_COMPLIANT if an IAM server certificate is expired.

Identifier: IAM_SERVER_CERTIFICATE_EXPIRATION_CHECK

Resource Types: AWS::IAM::ServerCertificate

Trigger type: Periodic

AWS Region: Only available in China (Beijing), US East (N. Virginia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iam-server-certificate-tagged

Checks if AWS IAM server certificates have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IAM_SERVER_CERTIFICATE_TAGGED

Resource Types: AWS::IAM::ServerCertificate

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iam-user-group-membership-check

Checks whether IAM users are members of at least one IAM group.

Identifier: IAM_USER_GROUP_MEMBERSHIP_CHECK

Resource Types: AWS::IAM::User

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

groupNames (Optional), Type: CSV

Comma-separated list of IAM groups in which IAM users must be members.

> **Note**
>
> This rule does not support group names with commas.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iam-user-mfa-enabled

Checks if the AWS Identity and Access Management (IAM) users have multi-factor authentication (MFA) enabled. The rule is NON_COMPLIANT if MFA is not enabled for at least one IAM user.

> **Note**
>
> **Managed Rules and Global IAM Resource Types**
> The global IAM resource types onboarded before February 2022 (`AWS::IAM::Group`, `AWS::IAM::Policy`, `AWS::IAM::Role`, and `AWS::IAM::User`) can only be recorded by AWS Config in AWS Regions where AWS Config was available before February 2022. These resource types cannot be recorded in Regions supported by AWS Config after February 2022. For a list of those Regions, see Recording AWS Resources | Global Resources.
> If you record a global IAM resource type in at least one Region, periodic rules that report compliance on the global IAM resource type will run evaluations in all Regions where the periodic rule is added, even if you have not enabled the recording of the global IAM resource type in the Region where the periodic rule was added.

To avoid unnecessary evaluations, you should only deploy periodic rules that report compliance on a global IAM resource type to one of the supported Regions. For a list of which managed rules are supported in which Regions, see List of AWS Config Managed Rules by Region Availability.

Identifier: IAM_USER_MFA_ENABLED

Resource Types: AWS::IAM::User

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iam-user-no-policies-check

Checks if none of your AWS Identity and Access Management (IAM) users have policies attached. IAM users must inherit permissions from IAM groups or roles. The rule is NON_COMPLIANT if there is at least one policy that is attached to the IAM user.

Identifier: IAM_USER_NO_POLICIES_CHECK

Resource Types: AWS::IAM::User

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico

(Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iam-user-unused-credentials-check

Checks if your AWS Identity and Access Management (IAM) users have passwords or active access keys that have not been used within the specified number of days you provided. The rule is NON_COMPLIANT if there are inactive accounts not recently used.

> **Note**
>
> **Re-evaluation Timeline**
> Re-evaluating this rule within 4 hours of the first evaluation will have no effect on the results.
> **Managed Rules and Global IAM Resource Types**
> The global IAM resource types onboarded before February 2022 (`AWS::IAM::Group`, `AWS::IAM::Policy`, `AWS::IAM::Role`, and `AWS::IAM::User`) can only be recorded by AWS Config in AWS Regions where AWS Config was available before February 2022. These resource types cannot be recorded in Regions supported by AWS Config after February 2022. For a list of those Regions, see Recording AWS Resources | Global Resources.
> If you record a global IAM resource type in at least one Region, periodic rules that report compliance on the global IAM resource type will run evaluations in all Regions where the periodic rule is added, even if you have not enabled the recording of the global IAM resource type in the Region where the periodic rule was added.
> To avoid unnecessary evaluations, you should only deploy periodic rules that report compliance on a global IAM resource type to one of the supported Regions. For a list of which managed rules are supported in which Regions, see List of AWS Config Managed Rules by Region Availability.

Identifier: IAM_USER_UNUSED_CREDENTIALS_CHECK

Resource Types: AWS::IAM::User

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

maxCredentialUsageAge, Type: int, Default: 90

Maximum number of days a credential cannot be used. The default value is 90 days.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

imagebuilder-distributionconfiguration-tagged

Checks if ImageBuilder DistributionConfiguration resources have tags. Optionally, required tag keys can be specified. The rule is NON_COMPLIANT if there are no tags or the specified tag keys are not present. It does not consider tags starting with 'aws:'.

Identifier: IMAGEBUILDER_DISTRIBUTIONCONFIGURATION_TAGGED

Resource Types: AWS::ImageBuilder::DistributionConfiguration

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

imagebuilder-imagepipeline-tagged

Checks if EC2 Image Builder image pipelines have tags. Optionally, required tag keys can be specified. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IMAGEBUILDER_IMAGEPIPELINE_TAGGED

Resource Types: AWS::ImageBuilder::ImagePipeline

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

imagebuilder-imagerecipe-ebs-volumes-encrypted

Checks that all Amazon EBS volumes in EC2 Image Builder image recipe block device mappings have encryption enabled. The rule is NON_COMPLIANT if not all EBS volumes have encryption enabled, or if there are no block device mappings defined.

Identifier: IMAGEBUILDER_IMAGERECIPE_EBS_VOLUMES_ENCRYPTED

Resource Types: AWS::ImageBuilder::ImageRecipe

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

imagebuilder-imagerecipe-tagged

Checks if AWS ImageBuilder image recipe resources have tags. Optionally, required tag keys can be specified. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IMAGEBUILDER_IMAGERECIPE_TAGGED

Resource Types: AWS::ImageBuilder::ImageRecipe

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

imagebuilder-infrastructureconfiguration-tagged

Checks if EC2 Image Builder infrastructure configuration resources have tags. Optionally, required tag keys can be specified. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present.

Identifier: IMAGEBUILDER_INFRASTRUCTURECONFIGURATION_TAGGED

Resource Types: AWS::ImageBuilder::InfrastructureConfiguration

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

restricted-ssh

> **Important**
>
> For this rule, the rule identifier (INCOMING_SSH_DISABLED) and rule name (restricted-ssh) are different.

Checks if the incoming SSH traffic for the security groups is accessible. The rule is COMPLIANT if the IP addresses of the incoming SSH traffic in the security groups are restricted (CIDR other than 0.0.0.0/0 or ::/0). Otherwise, NON_COMPLIANT.

Identifier: INCOMING_SSH_DISABLED

Resource Types: AWS::EC2::SecurityGroup

Trigger type: Configuration changes and Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

inspector-ec2-scan-enabled

Checks if Amazon Inspector V2 EC2 scanning is activated for your single or multi-account environment to detect potential vulnerabilities and network reachability issues on your EC2 instances. The rule is NON_COMPLIANT if EC2 scanning is not activated.

Identifier: INSPECTOR_EC2_SCAN_ENABLED

Resource Types: AWS::::Account

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Mexico (Central), Canada West (Calgary), Europe (Spain), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

inspector-ecr-scan-enabled

Checks if Amazon Inspector V2 ECR scanning is activated for your single or multi-account environment to detect potential software vulnerabilities in your container images. The rule is NON_COMPLIANT if ECR scanning is not activated.

Identifier: INSPECTOR_ECR_SCAN_ENABLED

Resource Types: AWS::::Account

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Mexico (Central), Canada West (Calgary), Europe (Spain), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

inspector-lambda-code-scan-enabled

Checks if Amazon Inspector V2 Lambda code scanning is activated for your single or multi-account environment to detect potential code vulnerabilities. The rule is NON_COMPLIANT if Lambda code scanning is not activated.

Identifier: INSPECTOR_LAMBDA_CODE_SCAN_ENABLED

Resource Types: AWS::::Account

Trigger type: Periodic

AWS Region: Only available in Europe (Stockholm), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

inspector-lambda-standard-scan-enabled

Checks if Amazon Inspector V2 Lambda standard scanning is activated for your single or multi-account environment to detect potential software vulnerabilities. The rule is NON_COMPLIANT if Lambda standard scanning is not activated.

Identifier: INSPECTOR_LAMBDA_STANDARD_SCAN_ENABLED

Resource Types: AWS::::Account

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ec2-instances-in-vpc

> **Important**
>
> For this rule, the rule identifier (INSTANCES_IN_VPC) and rule name (ec2-instances-in-vpc) are different.

Checks if your EC2 instances belong to a virtual private cloud (VPC). Optionally, you can specify the VPC ID to associate with your instances.

Identifier: INSTANCES_IN_VPC

Resource Types: AWS::EC2::Instance

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

vpcId (Optional), Type: String

VPC ID that contains these EC2 instances.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

internet-gateway-authorized-vpc-only

Checks if internet gateways are attached to an authorized virtual private cloud (Amazon VPC). The rule is NON_COMPLIANT if internet gateways are attached to an unauthorized VPC.

Identifier: INTERNET_GATEWAY_AUTHORIZED_VPC_ONLY

Resource Types: AWS::EC2::InternetGateway

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

AuthorizedVpcIds (Optional), Type: CSV

Comma-separated list of the authorized VPC IDs with attached IGWs. If parameter is not provided all attached IGWs will be NON_COMPLIANT.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iotdevicedefender-custom-metric-tagged

AWS IoT Device Defender custom metrics have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IOTDEVICEDEFENDER_CUSTOM_METRIC_TAGGED

Resource Types: AWS::IoT::CustomMetric

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Middle East (Bahrain), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Middle East (UAE), Europe (Frankfurt), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iotevents-alarm-model-tagged

Checks if AWS IoT Events alarm models have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IOTEVENTS_ALARM_MODEL_TAGGED

Resource Types: AWS::IoTEvents::AlarmModel

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iotevents-detector-model-tagged

Checks if AWS IoT Events detector models have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IOTEVENTS_DETECTOR_MODEL_TAGGED

Resource Types: AWS::IoTEvents::DetectorModel

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iotevents-input-tagged

Checks if AWS IoT Events inputs have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IOTEVENTS_INPUT_TAGGED

Resource Types: AWS::IoTEvents::Input

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iotsitewise-asset-model-tagged

Checks if AWS IoT SiteWise asset models have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IOTSITEWISE_ASSET_MODEL_TAGGED

Resource Types: AWS::IoTSiteWise::AssetModel

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iotsitewise-dashboard-tagged

Checks if AWS IoT SiteWise dashboards have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IOTSITEWISE_DASHBOARD_TAGGED

Resource Types: AWS::IoTSiteWise::Dashboard

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iotsitewise-gateway-tagged

Checks if AWS IoT SiteWise gateways have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IOTSITEWISE_GATEWAY_TAGGED

Resource Types: AWS::IoTSiteWise::Gateway

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iotsitewise-portal-tagged

Checks if AWS IoT SiteWise portals have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IOTSITEWISE_PORTAL_TAGGED

Resource Types: AWS::IoTSiteWise::Portal

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iotsitewise-project-tagged

Checks if AWS IoT SiteWise projects have tags. Optionally, you can specify tag keys for the rule. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IOTSITEWISE_PROJECT_TAGGED

Resource Types: AWS::IoTSiteWise::Project

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iottwinmaker-component-type-tagged

Checks if AWS IoT TwinMaker component types have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IOTTWINMAKER_COMPONENT_TYPE_TAGGED

Resource Types: AWS::IoTTwinMaker::ComponentType

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iottwinmaker-entity-tagged

Checks if AWS IoT TwinMaker entities have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IOTTWINMAKER_ENTITY_TAGGED

Resource Types: AWS::IoTTwinMaker::Entity

Trigger type: Configuration changes

AWS Region: Only available in Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iottwinmaker-scene-tagged

Checks if AWS IoT TwinMaker scenes have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IOTTWINMAKER_SCENE_TAGGED

Resource Types: AWS::IoTTwinMaker::Scene

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iottwinmaker-sync-job-tagged

Checks if AWS IoT TwinMaker sync jobs have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IOTTWINMAKER_SYNC_JOB_TAGGED

Resource Types: AWS::IoTTwinMaker::SyncJob

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iottwinmaker-workspace-tagged

Checks if AWS IoT TwinMaker workspaces have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IOTTWINMAKER_WORKSPACE_TAGGED

Resource Types: AWS::IoTTwinMaker::Workspace

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iotwireless-fuota-task-tagged

Checks if AWS IoT Wireless FUOTA tasks have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IOTWIRELESS_FUOTA_TASK_TAGGED

Resource Types: AWS::IoTWireless::FuotaTask

Trigger type: Configuration changes

AWS Region: Only available in Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iotwireless-multicast-group-tagged

Checks if AWS IoT Wireless multicast groups have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IOTWIRELESS_MULTICAST_GROUP_TAGGED

Resource Types: AWS::IoTWireless::MulticastGroup

Trigger type: Configuration changes

AWS Region: Only available in Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iotwireless-service-profile-tagged

Checks if AWS IoT Wireless service profiles have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IOTWIRELESS_SERVICE_PROFILE_TAGGED

Resource Types: AWS::IoTWireless::ServiceProfile

Trigger type: Configuration changes

AWS Region: Only available in Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Sydney) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iot-authorizer-token-signing-enabled

Checks if an AWS IoT Core authorizer has not disabled the signing requirements for validating the token signature in an authorization request. The rule is NON_COMPLIANT if the authorizer has configuration.SigningDisabled set to True.

Identifier: IOT_AUTHORIZER_TOKEN_SIGNING_ENABLED

Resource Types: AWS::IoT::Authorizer

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Middle East (Bahrain), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Middle East (UAE), Europe (Frankfurt), South America (Sao Paulo), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iot-job-template-tagged

Checks if AWS IoT job template resources resources have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IOT_JOB_TEMPLATE_TAGGED

Resource Types: AWS::IoT::JobTemplate

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Middle East (Bahrain), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Middle East (UAE), Europe (Frankfurt), South America (Sao Paulo), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iot-provisioning-template-description

Checks if AWS IoT provisioning templates have a description. The rule is NON_COMPLIANT if configuration.Description does not exist or is an empty string.

Identifier: IOT_PROVISIONING_TEMPLATE_DESCRIPTION

Resource Types: AWS::IoT::ProvisioningTemplate

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Middle East (Bahrain), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Middle East (UAE), Europe (Frankfurt), South America (Sao Paulo), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iot-provisioning-template-jitp

Checks if AWS IoT provisioning templates are using just-in-time provisioning (JITP). The rule is NON_COMPLIANT if configuration.TemplateType is not 'JITP'.

Identifier: IOT_PROVISIONING_TEMPLATE_JITP

Resource Types: AWS::IoT::ProvisioningTemplate

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Middle East (Bahrain), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Middle East (UAE), Europe (Frankfurt), South America (Sao Paulo), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iot-provisioning-template-tagged

Checks if AWS IoT provisioning templates have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IOT_PROVISIONING_TEMPLATE_TAGGED

Resource Types: AWS::IoT::ProvisioningTemplate

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Middle East (Bahrain), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Middle East (UAE), Europe (Frankfurt), South America (Sao Paulo), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

iot-scheduled-audit-tagged

Checks if AWS IoT scheduled audits have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IOT_SCHEDULED_AUDIT_TAGGED

Resource Types: AWS::IoT::ScheduledAudit

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Middle East (Bahrain), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Middle East (UAE), Europe (Frankfurt), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ivs-channel-playback-authorization-enabled

Checks if Amazon IVS channels have playback authorization enabled. The rule is NON_COMPLIANT if configuration.Authorized is false.

Identifier: IVS_CHANNEL_PLAYBACK_AUTHORIZATION_ENABLED

Resource Types: AWS::IVS::Channel

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Tokyo), US West (Oregon) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ivs-channel-tagged

Checks if Amazon IVS channels have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IVS_CHANNEL_TAGGED

Resource Types: AWS::IVS::Channel

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Tokyo), US West (Oregon) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ivs-playback-key-pair-tagged

Checks if Amazon IVS playback key pairs have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IVS_PLAYBACK_KEY_PAIR_TAGGED

Resource Types: AWS::IVS::PlaybackKeyPair

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Tokyo), US West (Oregon) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ivs-recording-configuration-tagged

Checks if Amazon IVS recording configurations have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: IVS_RECORDING_CONFIGURATION_TAGGED

Resource Types: AWS::IVS::RecordingConfiguration

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Tokyo), US West (Oregon) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

kendra-index-tagged

Checks if AWS Kendra index resources have tags. Optionally, required tag keys can be specified. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: KENDRA_INDEX_TAGGED

Resource Types: AWS::Kendra::Index

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), US East (Ohio), Europe (Ireland), US East (N. Virginia), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

kinesisvideo-signalingchannel-tagged

Checks if AWS KinesisVideo signaling channel resources have tags. Optionally, required tag keys can be specified. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. It does not check for tags starting with 'aws:'.

Identifier: KINESISVIDEO_SIGNALINGCHANNEL_TAGGED

Resource Types: AWS::KinesisVideo::SignalingChannel

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

kinesisvideo-stream-tagged

Checks if Amazon Kinesis Video Streams streams have tags. Optionally, required tag keys can be specified. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not consider tags starting with 'aws:'.

Identifier: KINESISVIDEO_STREAM_TAGGED

Resource Types: AWS::KinesisVideo::Stream

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

kinesis-firehose-delivery-stream-encrypted

Checks if Amazon Kinesis Data Firehose delivery streams are encrypted at rest with server-side encryption. The rule is NON_COMPLIANT if a Kinesis Data Firehose delivery stream is not encrypted at rest with server-side encryption.

Identifier: KINESIS_FIREHOSE_DELIVERY_STREAM_ENCRYPTED

Resource Types: AWS::KinesisFirehose::DeliveryStream

Trigger type: Periodic

AWS Region: All supported AWS regions except China (Beijing), China (Ningxia) Region

Parameters:

kmsKeyArns (Optional), Type: CSV

Comma-separated list of KMS Key Arns that are approved for Kinesis Firehose usage.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

kinesis-stream-backup-retention-check

Checks if an Amazon Kinesis Data Stream has its data record retention period set to a specific number of hours. The rule is NON_COMPLIANT if the property `RetentionPeriodHours` is set to a value less than the value specified by the parameter.

Identifier: KINESIS_STREAM_BACKUP_RETENTION_CHECK

Resource Types: AWS::Kinesis::Stream

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Canada West (Calgary) Region

Parameters:

minimumBackupRetentionPeriod (Optional), Type: String

Minimum hours data records should be retained. Valid values are 24 to 8760, default value is 168.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

kinesis-stream-encrypted

Checks if Amazon Kinesis streams are encrypted at rest with server-side encryption. The rule is NON_COMPLIANT for a Kinesis stream if 'StreamEncryption' is not present.

Context: Server-side encryption is a feature in Amazon Kinesis Data Streams that automatically encrypts data before it's at rest by using an AWS KMS Key. Data is encrypted before it's written to the Kinesis stream storage layer, and decrypted after it's retrieved from storage. As a result, your data is encrypted at rest within the Kinesis Data Streams service. This can help you to meet regulatory requirements and enhance the security of your data. For more information, Data Protection in Amazon Kinesis Data Streams.

Identifier: KINESIS_STREAM_ENCRYPTED

Resource Types: AWS::Kinesis::Stream

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

kinesis-video-stream-minimum-data-retention

Checks if an Amazon Kinesis Video stream is configured with a value greater than or equal to the specified minimum data retention. The rule is NON_COMPLIANT if DataRetentionInHours is less than the value specified in the required rule parameter.

Identifier: KINESIS_VIDEO_STREAM_MINIMUM_DATA_RETENTION

Resource Types: AWS::KinesisVideo::Stream

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

minDataRetentionInHours, Type: int

The minimum data retention in hours of the Amazon Kinesis Video stream for the rule to check. The rule is NON_COMPLIANT if the data retention in hours is less than the value specified in this parameter. Valid values are 0 to 87600.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

kms-cmk-not-scheduled-for-deletion

Checks if AWS Key Management Service (AWS KMS) keys are not scheduled for deletion in AWS KMS. The rule is NON_COMPLIANT if KMS keys are scheduled for deletion.

Identifier: KMS_CMK_NOT_SCHEDULED_FOR_DELETION

Resource Types: AWS::KMS::Key

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Europe (Milan), Asia Pacific (Taipei) Region

Parameters:

kmsKeyIds (Optional), Type: String

(Optional) Comma-separated list of specific customer managed key IDs not to be scheduled for deletion. If you do not specify any keys, the rule checks all the keys.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

kms-key-policy-no-public-access

Checks if the AWS KMS key policy allows public access. The rule is NON_COMPLIANT if the KMS key policy allows public access to the KMS key.

> **Note**
>
> To be considered non-public, a KMS key policy must grant access only to fixed values. This means values that don't contain a wildcard or the following IAM policy element: Variables.

Identifier: KMS_KEY_POLICY_NO_PUBLIC_ACCESS

Resource Types: AWS::KMS::Key

Trigger type: Configuration changes

AWS Region: All supported AWS regions except AWS GovCloud (US-East), AWS GovCloud (US-West), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

kms-key-tagged

Checks if AWS Key Management Service (KMS) keys have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: KMS_KEY_TAGGED

Resource Types: AWS::KMS::Key

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

lambda-code-signing-configuration-tagged

Checks if AWS Lambda code signing configurations have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: LAMBDA_CODE_SIGNING_CONFIGURATION_TAGGED

Resource Types: AWS::Lambda::CodeSigningConfig

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Africa (Cape Town), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Europe (Milan), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

lambda-concurrency-check

Checks if the Lambda function is configured with a function-level concurrent execution limit. The rule is NON_COMPLIANT if the Lambda function is not configured with a function-level concurrent execution limit.

Identifier: LAMBDA_CONCURRENCY_CHECK

Resource Types: AWS::Lambda::Function

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Ningxia) Region

Parameters:

ConcurrencyLimitHigh (Optional), Type: String

Maximum concurrency execution limit

ConcurrencyLimitLow (Optional), Type: String

Minimum concurrency execution limit

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

lambda-dlq-check

Checks whether an AWS Lambda function is configured with a dead-letter queue. The rule is NON_COMPLIANT if the Lambda function is not configured with a dead-letter queue.

Identifier: LAMBDA_DLQ_CHECK

Resource Types: AWS::Lambda::Function

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Ningxia) Region

Parameters:

dlqArns (Optional), Type: CSV

Comma-separated list of Amazon SQS and Amazon SNS ARNs that must be configured as the Lambda function dead-letter queue target

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

lambda-function-application-log-level-check

Checks if AWS Lambda functions with JSON structured logs are configured with a specified application log level. The rule is NON_COMPLIANT if configuration.loggingConfig.applicationLogLevel is not a value specified in the required rule parameter.

Identifier: LAMBDA_FUNCTION_APPLICATION_LOG_LEVEL_CHECK

Resource Types: AWS::Lambda::Function

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), China (Ningxia) Region

Parameters:

logLevel, Type: String

The minimum application log level for the rule to check. The rule is NON_COMPLIANT if configuration.loggingConfig.applicationLogLevel is configured with a value not specified in this parameter. Valid values include: 'TRACE', 'DEBUG', 'INFO', 'WARN', 'ERROR', and 'FATAL'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

lambda-function-description

Checks if AWS Lambda functions have a description. The rule is NON_COMPLIANT if configuration.description does not exist or is an empty string.

Identifier: LAMBDA_FUNCTION_DESCRIPTION

Resource Types: AWS::Lambda::Function

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

lambda-function-log-format-json

Checks if AWS Lambda functions have the log format set to JSON for more control and better readability. The rule is NON_COMPLIANT if configuration.loggingConfig.logFormat is not 'JSON'.

Identifier: LAMBDA_FUNCTION_LOG_FORMAT_JSON

Resource Types: AWS::Lambda::Function

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

lambda-function-public-access-prohibited

Checks if the AWS Lambda function policy attached to the Lambda resource prohibits public access. If the Lambda function policy allows public access it is NON_COMPLIANT.

Context: A lambda function policy is considered to allow public access if the principal element is empty or contains a wildcard. For example, if the principal element is `“”` or `{“AWS”: “”}`. Granting public access is not recommended for security reasons. Restricting public access can help you prevent unauthorized invocations of your Lambda functions, which could compromise your data or incur unwanted costs.

To restrict access to your Lambda functions, specify the AWS account IDs or the Amazon Resource Names (ARNs) of the IAM users, roles, or services that can invoke the functions. For more information, see Granting function access to other accounts in the *AWS Lambda Developer Guide*.

The rule is also `NON_COMPLIANT` if a Lambda function is invoked from Amazon S3, and the policy doesn't include a condition to limit public access, such as `AWS:SourceAccount`. We recommend using other S3 conditions along with `AWS:SourceAccount` in your bucket policy for more refined access.

> **Note**
>
> To be considered non-public, a Lambda resource-based policy must grant access only to fixed values. This means values that don't contain a wildcard or the following IAM policy element: Variables.

> **Note**
>
> If a single value in a Lambda function resource-based policy (for example, one Resource or Condition value) contains more than five IAM policy variables, the rule can't evaluate that policy and returns NON_COMPLIANT, even if the policy would otherwise be compliant. To get an accurate evaluation, split any value that contains more than five policy variables so that each value contains five or fewer.

Identifier: LAMBDA_FUNCTION_PUBLIC_ACCESS_PROHIBITED

Resource Types: AWS::Lambda::Function

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

lambda-function-settings-check

Checks if the AWS Lambda function settings for runtime, role, timeout, and memory size match the expected values. The rule ignores functions with the 'Image' package type and functions with runtime set to 'OS-only Runtime'. The rule is NON_COMPLIANT if the Lambda function settings do not match the expected values.

Identifier: LAMBDA_FUNCTION_SETTINGS_CHECK

Resource Types: AWS::Lambda::Function

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Ningxia) Region

Parameters:

runtime, Type: CSV

Comma-separated list of AWS Lambda runtime values

memorySize (Optional), Type: int, Default: 128

AWS Lambda function size in megabytes

role (Optional), Type: String

Name or ARN of the AWS Lambda execution role

timeout (Optional), Type: int, Default: 3

AWS Lambda function timeout in seconds

Proactive Evaluation

For steps on how to run this rule in proactive mode, see Evaluating Your Resources with AWS Config Rules. For this rule to return COMPLIANT in proactive mode, the resource configuration schema for the StartResourceEvaluation API needs to include the following inputs, encoded as a string:

```
"ResourceConfiguration":
...
{
    "MemorySize": Integer*,
    "Role": String*,
    "Runtime": String*,
    "Timeout": Integer*
}
...
```

*For more information on valid values for these inputs, see MemorySize, Role, Runtime, and Timeout in the AWS CloudFormation User Guide.

For more information on proactive evaluation, see Evaluation Mode.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

lambda-function-system-log-level-check

Checks if AWS Lambda functions with JSON structured logs are configured with a specified system log level. The rule is NON_COMPLIANT if configuration.loggingConfig.systemLogLevel is not a value specified in the required rule parameter.

Identifier: LAMBDA_FUNCTION_SYSTEM_LOG_LEVEL_CHECK

Resource Types: AWS::Lambda::Function

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), China (Ningxia) Region

Parameters:

logLevel, Type: String

The minimum system log level for the rule to check. The rule is NON_COMPLIANT if configuration.loggingConfig.systemLogLevel is configured with a value not specified in this parameter. Valid values include: 'DEBUG', 'INFO', and 'WARN'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

lambda-function-tagged

Checks if AWS Lambda functions have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: LAMBDA_FUNCTION_TAGGED

Resource Types: AWS::Lambda::Function

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Middle East (Bahrain), Middle East (UAE), AWS GovCloud (US-East), AWS GovCloud (US-West) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

lambda-function-xray-enabled

Checks if AWS X-Ray is enabled on AWS Lambda functions.The rule is NON_COMPLIANT if X-Ray tracing is disabled for a Lambda function.

Identifier: LAMBDA_FUNCTION_XRAY_ENABLED

Resource Types: AWS::Lambda::Function

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

lambda-inside-vpc

Checks if a Lambda function is allowed access to a virtual private cloud (VPC). The rule is NON_COMPLIANT if the Lambda function is not VPC enabled.

Identifier: LAMBDA_INSIDE_VPC

Resource Types: AWS::Lambda::Function

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Ningxia) Region

Parameters:

subnetIds (Optional), Type: CSV

Comma-separated list of subnet IDs that Lambda functions must be associated with.

Proactive Evaluation

For steps on how to run this rule in proactive mode, see Evaluating Your Resources with AWS Config Rules. For this rule to return COMPLIANT in proactive mode, the resource configuration schema for the StartResourceEvaluation API needs to include the following inputs, encoded as a string:

```
"ResourceConfiguration":
...
{
   "VpcConfig": {
         "SubnetIds": "[SubnetId-1, SubnetId-2, SubnetId-3, ...]"
   }
}
...
```

For more information on proactive evaluation, see Evaluation Mode.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

lambda-vpc-multi-az-check

Checks if Lambda has more than 1 availability zone associated. The rule is NON_COMPLIANT if only 1 availability zone is associated with the Lambda or the number of availability zones associated is less than number specified in the optional parameter.

Identifier: LAMBDA_VPC_MULTI_AZ_CHECK

Resource Types: AWS::Lambda::Function

Trigger type: Configuration changes

AWS Region: All supported AWS regions except AWS GovCloud (US-East), AWS GovCloud (US-West), China (Ningxia) Region

Parameters:

availabilityZones (Optional), Type: int

Number of expected Availability zones.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

lightsail-bucket-allow-public-overrides-disabled

Checks if Amazon Lightsail buckets have allow public overrides disabled. The rule is NON_COMPLIANT if AllowPublicOverrides is true. Note: AllowPublicOverrides has no effect if GetObject is public, see lightsail-bucket-get-object-private.

Identifier: LIGHTSAIL_BUCKET_ALLOW_PUBLIC_OVERRIDES_DISABLED

Resource Types: AWS::Lightsail::Bucket

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

lightsail-bucket-object-versioning-enabled

Checks if Amazon Lightsail Bucket resources have object versioning enabled to protect against unintended deletions and modifications. The rule is NON_COMPLIANT if the bucket does not have object versioning enabled.

Identifier: LIGHTSAIL_BUCKET_OBJECT_VERSIONING_ENABLED

Resource Types: AWS::Lightsail::Bucket

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

lightsail-bucket-tagged

Checks if Amazon Lightsail buckets have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: LIGHTSAIL_BUCKET_TAGGED

Resource Types: AWS::Lightsail::Bucket

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe

(London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

lightsail-certificate-tagged

Checks if Amazon Lightsail certificates have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: LIGHTSAIL_CERTIFICATE_TAGGED

Resource Types: AWS::Lightsail::Certificate

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

lightsail-disk-tagged

Checks if Amazon Lightsail disks have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: LIGHTSAIL_DISK_TAGGED

Resource Types: AWS::Lightsail::Disk

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

macie-auto-sensitive-data-discovery-check

Checks if automated sensitive data discovery is enabled for Amazon Macie. The rule is NON_COMPLIANT if automated sensitive data discovery is disabled. The rule is APPLICABLE for administrator accounts and NOT_APPLICABLE for member accounts.

Identifier: MACIE_AUTO_SENSITIVE_DATA_DISCOVERY_CHECK

Resource Types: AWS::::Account

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

macie-status-check

Checks if Amazon Macie is enabled in your account per region. The rule is NON_COMPLIANT if the 'status' attribute is not set to 'ENABLED'.

Identifier: MACIE_STATUS_CHECK

Resource Types: AWS::::Account

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

mariadb-publish-logs-to-cloudwatch-logs

Checks if Amazon MariaDB database instances are configured to publish logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if a database instance is not configured to publish logs to CloudWatch Logs.

Identifier: MARIADB_PUBLISH_LOGS_TO_CLOUDWATCH_LOGS

Resource Types: AWS::RDS::DBInstance

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

logTypes (Optional), Type: String

> Comma-separated list of log types for the rule to check. If not provided, the rule checks for the default log types: 'error' and 'audit'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

mediapackage-packagingconfiguration-tagged

Checks if AWS Elemental MediaPackage packaging configuration resources have tags. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: MEDIAPACKAGE_PACKAGINGCONFIGURATION_TAGGED

Resource Types: AWS::MediaPackage::PackagingConfiguration

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Osaka), Europe (London), Asia Pacific (Melbourne), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

mediatailor-playbackconfiguration-tagged

Checks if AWS Elemental MediaTailor playback configurations have tags. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: MEDIATAILOR_PLAYBACKCONFIGURATION_TAGGED

Resource Types: AWS::MediaTailor::PlaybackConfiguration

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Africa (Cape Town), Europe (Ireland), Middle East (UAE), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Osaka), Asia Pacific (Melbourne),

Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

memorydb-subnetgroup-tagged

Checks if Amazon MemoryDB subnet group resources have tags. Optionally, required tag keys can be specified. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: MEMORYDB_SUBNETGROUP_TAGGED

Resource Types: AWS::MemoryDB::SubnetGroup

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

mfa-enabled-for-iam-console-access

Checks if AWS multi-factor authentication (MFA) is enabled for all AWS Identity and Access Management (IAM) users that use a console password. The rule is COMPLIANT if MFA is enabled.

> **Note**
>
> **Re-evaluation Timeline**
> Re-evaluating this rule within 4 hours of the first evaluation will have no effect on the results.
>
> **Managed Rules and Global IAM Resource Types**
> The global IAM resource types onboarded before February 2022 (`AWS::IAM::Group`, `AWS::IAM::Policy`, `AWS::IAM::Role`, and `AWS::IAM::User`) can only be recorded by AWS Config in AWS Regions where AWS Config was available before February 2022. These resource types cannot be recorded in Regions supported by AWS Config after February 2022. For a list of those Regions, see Recording AWS Resources | Global Resources.
> If you record a global IAM resource type in at least one Region, periodic rules that report compliance on the global IAM resource type will run evaluations in all Regions where the periodic rule is added, even if you have not enabled the recording of the global IAM resource type in the Region where the periodic rule was added.
> To avoid unnecessary evaluations, you should only deploy periodic rules that report compliance on a global IAM resource type to one of the supported Regions. For a list of which managed rules are supported in which Regions, see List of AWS Config Managed Rules by Region Availability.

Identifier: MFA_ENABLED_FOR_IAM_CONSOLE_ACCESS

Resource Types: AWS::IAM::User

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico

(Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

mq-active-broker-ldap-authentication

Checks if Amazon MQ ActiveMQ brokers use the LDAP authentication strategy to secure the broker. The rule is NON_COMPLIANT if configuration.AuthenticationStrategy is not 'ldap'.

Identifier: MQ_ACTIVE_BROKER_LDAP_AUTHENTICATION

Resource Types: AWS::AmazonMQ::Broker

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

mq-active-deployment-mode

Checks the deployment mode configured for Amazon MQ ActiveMQ broker engine. The rule is NON_COMPLIANT if the default single-instance broker mode is being used.

Identifier: MQ_ACTIVE_DEPLOYMENT_MODE

Resource Types: AWS::AmazonMQ::Broker

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Hyderabad), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

mq-active-single-instance-broker-storage-type-efs

Checks if an Amazon MQ for ActiveMQ single-instance broker using the mq.m5 instance type family is configured with Amazon Elastic File System (EFS) for broker storage. The rule is NON_COMPLIANT if configuration.StorageType is not 'efs'.

Identifier: MQ_ACTIVE_SINGLE_INSTANCE_BROKER_STORAGE_TYPE_EFS

Resource Types: AWS::AmazonMQ::Broker

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

mq-automatic-minor-version-upgrade-enabled

Checks if automatic minor version upgrades are enabled for Amazon MQ brokers. The rule is NON_COMPLIANT if the 'AutoMinorVersionUpgrade' field is not enabled for an Amazon MQ broker.

Identifier: MQ_AUTOMATIC_MINOR_VERSION_UPGRADE_ENABLED

Resource Types: AWS::AmazonMQ::Broker

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

mq-auto-minor-version-upgrade-enabled

Checks if automatic minor version upgrades are enabled for Amazon MQ brokers. The rule is NON_COMPLIANT if the 'AutoMinorVersionUpgrade' field is not enabled for an Amazon MQ broker.

Identifier: MQ_AUTO_MINOR_VERSION_UPGRADE_ENABLED

Resource Types: AWS::AmazonMQ::Broker

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

mq-broker-general-logging-enabled

Checks if Amazon MQ brokers have general logging enabled. The rule is NON_COMPLIANT if configuration.Logs.General is false.

Identifier: MQ_BROKER_GENERAL_LOGGING_ENABLED

Resource Types: AWS::AmazonMQ::Broker

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

mq-cloudwatch-audit-logging-enabled

Checks if Amazon MQ brokers have Amazon CloudWatch audit logging enabled. The rule is NON_COMPLIANT if a broker does not have audit logging enabled.

Identifier: MQ_CLOUDWATCH_AUDIT_LOGGING_ENABLED

Resource Types: AWS::AmazonMQ::Broker

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

mq-cloudwatch-audit-log-enabled

Checks if an Amazon MQ broker has CloudWatch audit logging enabled. The rule is NON_COMPLIANT if the broker does not have audit logging enabled.

Identifier: MQ_CLOUDWATCH_AUDIT_LOG_ENABLED

Resource Types: AWS::AmazonMQ::Broker

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Hyderabad), Mexico (Central), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

mq-no-public-access

Checks if Amazon MQ brokers are not publicly accessible. The rule is NON_COMPLIANT if the 'PubliclyAccessible' field is set to true for an Amazon MQ broker.

Identifier: MQ_NO_PUBLIC_ACCESS

Resource Types: AWS::AmazonMQ::Broker

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Africa (Cape Town), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

mq-rabbit-deployment-mode

Checks the deployment mode configured for the Amazon MQ RabbitMQ broker engine. The rule is NON_COMPLIANT if the default single-instance broker mode is being used.

Identifier: MQ_RABBIT_DEPLOYMENT_MODE

Resource Types: AWS::AmazonMQ::Broker

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

msk-cluster-public-access-disabled

Checks if public access is disabled on Amazon MSK clusters. The rule is NON_COMPLIANT if public access on an Amazon MSK cluster is not disabled.

Identifier: MSK_CLUSTER_PUBLIC_ACCESS_DISABLED

Resource Types: AWS::MSK::Cluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (Malaysia), Mexico (Central), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

msk-cluster-tagged

Checks if Amazon MSK clusters have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: MSK_CLUSTER_TAGGED

Resource Types: AWS::MSK::Cluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

msk-connect-connector-logging-enabled

Checks if Amazon MSK Connector has logging enabled to any one of the log destinations. The rule is NON_COMPLIANT if Amazon MSK Connector does not have logging enabled.

Identifier: MSK_CONNECT_CONNECTOR_LOGGING_ENABLED

Resource Types: AWS::KafkaConnect::Connector

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), Asia Pacific (Jakarta), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Malaysia), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Israel (Tel Aviv), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

msk-enhanced-monitoring-enabled

Checks if enhanced monitoring is enabled for an Amazon MSK cluster set to PER_TOPIC_PER_BROKER or PER_TOPIC_PER_PARTITION. The rule is NON_COMPLIANT if enhanced monitoring is enabled and set to DEFAULT or PER_BROKER.

Identifier: MSK_ENHANCED_MONITORING_ENABLED

Resource Types: AWS::MSK::Cluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

msk-in-cluster-node-require-tls

Checks if an Amazon MSK cluster enforces encryption in transit using HTTPS (TLS) with the broker nodes of the cluster. The rule is NON_COMPLIANT if plain text communication is enabled for in-cluster broker node connections.

Identifier: MSK_IN_CLUSTER_NODE_REQUIRE_TLS

Resource Types: AWS::MSK::Cluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

msk-unrestricted-access-check

Checks if an Amazon MSK Cluster has unauthenticated access disabled. The rule is NON_COMPLIANT if Amazon MSK Cluster has unauthenticated access enabled.

Identifier: MSK_UNRESTRICTED_ACCESS_CHECK

Resource Types: AWS::MSK::Cluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Malaysia), Mexico (Central), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

multi-region-cloudtrail-enabled

> **Important**
>
> For this rule, the rule identifier (MULTI_REGION_CLOUD_TRAIL_ENABLED) and rule name (multi-region-cloudtrail-enabled) are different.

Checks if there is at least one multi-region AWS CloudTrail. The rule is NON_COMPLIANT if the trails do not match input parameters. The rule is NON_COMPLIANT if the `ExcludeManagementEventSources` field is not empty or if AWS CloudTrail is configured to exclude management events such as AWS KMS events or Amazon RDS Data API events.

Identifier: MULTI_REGION_CLOUD_TRAIL_ENABLED

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

cloudWatchLogsLogGroupArn (Optional), Type: String

Amazon CloudWatch log group ARN for AWS CloudTrail to send data to.

includeManagementEvents (Optional), Type: boolean

Event selector to include management events for the AWS CloudTrail.

readWriteType (Optional), Type: String

Type of events to record. Valid values are ReadOnly, WriteOnly and ALL.

s3BucketName (Optional), Type: String

Name of Amazon S3 bucket for AWS CloudTrail to deliver log files to.

snsTopicArn (Optional), Type: String

Amazon SNS topic ARN for AWS CloudTrail to use for notifications.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

nacl-no-unrestricted-ssh-rdp

Checks if default ports for SSH/RDP ingress traffic for network access control lists (NACLs) is unrestricted. The rule is NON_COMPLIANT if a NACL inbound entry allows a source TCP or UDP CIDR block for ports 22 or 3389.

Identifier: NACL_NO_UNRESTRICTED_SSH_RDP

Resource Types: AWS::EC2::NetworkAcl

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

neptune-cluster-backup-retention-check

Checks if an Amazon Neptune DB cluster retention period is set to specific number of days. The rule is NON_COMPLIANT if the retention period is less than the value specified by the parameter.

Identifier: NEPTUNE_CLUSTER_BACKUP_RETENTION_CHECK

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Europe (Milan), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

minimumBackupRetentionPeriod (Optional), Type: int

> Minimum days backups should be kept. Valid values 1 to 35, default value is 7. The rule is NON_COMPLIANT if value is greater than 'backupRetentionPeriod'. The rule is COMPLIANT if value is less than or equal to 'backupRetentionPeriod'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

neptune-cluster-cloudwatch-log-export-enabled

Checks if an Amazon Neptune cluster has CloudWatch log export enabled for audit logs. The rule is NON_COMPLIANT if a Neptune cluster does not have CloudWatch log export enabled for audit logs.

Identifier: NEPTUNE_CLUSTER_CLOUDWATCH_LOG_EXPORT_ENABLED

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Europe (Milan), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

neptune-cluster-copy-tags-to-snapshot-enabled

Checks if an Amazon Neptune cluster is configured to copy all tags to snapshots when the snapshots are created. The rule is NON_COMPLIANT if 'copyTagsToSnapshot' is set to false.

Identifier: NEPTUNE_CLUSTER_COPY_TAGS_TO_SNAPSHOT_ENABLED

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Europe (Milan), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

neptune-cluster-deletion-protection-enabled

Checks if an Amazon Neptune DB cluster has deletion protection enabled. The rule is NON_COMPLIANT if an Amazon Neptune cluster has the deletionProtection field set to false.

Identifier: NEPTUNE_CLUSTER_DELETION_PROTECTION_ENABLED

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Europe (Milan), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

neptune-cluster-encrypted

Checks if storage encryption is enabled for your Amazon Neptune DB clusters. The rule is NON_COMPLIANT if storage encryption is not enabled.

Identifier: NEPTUNE_CLUSTER_ENCRYPTED

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Europe (Milan), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

KmsKeyArns (Optional), Type: CSV

A comma-separated list of KMS key ARNs to compare with the KmsKeyId of the encrypted cluster.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

neptune-cluster-iam-database-authentication

Checks if an Amazon Neptune cluster has AWS Identity and Access Management (IAM) database authentication enabled. The rule is NON_COMPLIANT if an Amazon Neptune cluster does not have IAM database authentication enabled.

Identifier: NEPTUNE_CLUSTER_IAM_DATABASE_AUTHENTICATION

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Europe (Milan), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

neptune-cluster-multi-az-enabled

Checks if an Amazon Neptune cluster is configured with Amazon RDS Multi-AZ replication. The rule is NON_COMPLIANT if Multi-AZ replication is not enabled.

Identifier: NEPTUNE_CLUSTER_MULTI_AZ_ENABLED

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Europe

(Milan), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

neptune-cluster-snapshot-encrypted

Checks if an Amazon Neptune DB cluster has snapshots encrypted. The rule is NON_COMPLIANT if a Neptune cluster does not have snapshots encrypted.

Identifier: NEPTUNE_CLUSTER_SNAPSHOT_ENCRYPTED

Resource Types: AWS::RDS::DBClusterSnapshot

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Europe (Milan), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

neptune-cluster-snapshot-iam-database-auth-enabled

Checks if Amazon Neptune cluster snapshots have IAM database authentication enabled. The rule is NON_COMPLIANT if configuration.iamdatabaseAuthenticationEnabled is false.

Identifier: NEPTUNE_CLUSTER_SNAPSHOT_IAM_DATABASE_AUTH_ENABLED

Resource Types: AWS::RDS::DBClusterSnapshot

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Hyderabad), Europe (Milan), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

neptune-cluster-snapshot-public-prohibited

Checks if an Amazon Neptune manual DB cluster snapshot is public. The rule is NON_COMPLIANT if any existing and new Neptune cluster snapshot is public.

Identifier: NEPTUNE_CLUSTER_SNAPSHOT_PUBLIC_PROHIBITED

Resource Types: AWS::RDS::DBClusterSnapshot

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Europe (Milan), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

netfw-deletion-protection-enabled

Checks if AWS Network Firewall has deletion protection enabled. The rule is NON_COMPLIANT if Network Firewall does not have deletion protection enabled.

Identifier: NETFW_DELETION_PROTECTION_ENABLED

Resource Types: AWS::NetworkFirewall::Firewall

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

netfw-logging-enabled

Checks if AWS Network Firewall firewalls have logging enabled. The rule is NON_COMPLIANT if a logging type is not configured. You can specify which logging type you want the rule to check.

Identifier: NETFW_LOGGING_ENABLED

Resource Types: AWS::NetworkFirewall::LoggingConfiguration

Trigger type: Periodic

AWS Region: All supported AWS regions except China (Beijing), Asia Pacific (Thailand), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Canada West (Calgary), China (Ningxia) Region

Parameters:

logType (Optional), Type: String

logType (Optional): Log type for the rule to check for firewalls: 'alert', 'flow', or 'both'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

netfw-multi-az-enabled

Checks if AWS Network Firewall firewalls are deployed across multiple Availability Zones. The rule is NON_COMPLIANT if firewalls are deployed in only one Availability Zone or in fewer zones than the number listed in the optional parameter.

Identifier: NETFW_MULTI_AZ_ENABLED

Resource Types: AWS::NetworkFirewall::Firewall

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Canada West (Calgary), China (Ningxia) Region

Parameters:

availabilityZones (Optional), Type: int

The number of expected Availability Zones.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

netfw-policy-default-action-fragment-packets

Checks if an AWS Network Firewall policy is configured with a user defined stateless default action for fragmented packets. The rule is NON_COMPLIANT if stateless default action for fragmented packets does not match with user defined default action.

Identifier: NETFW_POLICY_DEFAULT_ACTION_FRAGMENT_PACKETS

Resource Types: AWS::NetworkFirewall::FirewallPolicy

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Canada West (Calgary), China (Ningxia) Region

Parameters:

statelessFragmentDefaultActions, Type: CSV

> Comma-separated list of values. You can select a max of two. Valid values include 'aws:pass', 'aws:drop', and 'aws:forward_to_sfe'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

netfw-policy-default-action-full-packets

Checks if an AWS Network Firewall policy is configured with a user defined default stateless action for full packets. This rule is NON_COMPLIANT if default stateless action for full packets does not match with user defined default stateless action.

Identifier: NETFW_POLICY_DEFAULT_ACTION_FULL_PACKETS

Resource Types: AWS::NetworkFirewall::FirewallPolicy

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Canada West (Calgary), China (Ningxia) Region

Parameters:

statelessDefaultActions, Type: CSV

Comma-separated list of values. You can select a max of two. Valid values include 'aws:pass', 'aws:drop', and 'aws:forward_to_sfe'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

netfw-policy-rule-group-associated

Check AWS Network Firewall policy is associated with stateful OR stateless rule groups. This rule is NON_COMPLIANT if no stateful or stateless rule groups are associated with the Network Firewall policy else COMPLIANT if any one of the rule group exists.

Identifier: NETFW_POLICY_RULE_GROUP_ASSOCIATED

Resource Types: AWS::NetworkFirewall::FirewallPolicy

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing), Mexico (Central), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

netfw-stateless-rule-group-not-empty

Checks if a Stateless Network Firewall Rule Group contains rules. The rule is NON_COMPLIANT if there are no rules in a Stateless Network Firewall Rule Group.

Identifier: NETFW_STATELESS_RULE_GROUP_NOT_EMPTY

Resource Types: AWS::NetworkFirewall::RuleGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing), Mexico (Central), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

netfw-subnet-change-protection-enabled

Checks if AWS Network Firewall has subnet change protection enabled. The rule is NON_COMPLIANT if subnet change protection is not enabled.

Identifier: NETFW_SUBNET_CHANGE_PROTECTION_ENABLED

Resource Types: AWS::NetworkFirewall::Firewall

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

nlb-cross-zone-load-balancing-enabled

Checks if cross-zone load balancing is enabled on Network Load Balancers (NLBs). The rule is NON_COMPLIANT if cross-zone load balancing is not enabled for an NLB.

Identifier: NLB_CROSS_ZONE_LOAD_BALANCING_ENABLED

Resource Types: AWS::ElasticLoadBalancingV2::LoadBalancer

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

nlb-internal-scheme-check

Checks if a Network Load Balancer scheme is internal. The rule is NON_COMPLIANT if configuration.scheme is not set to internal.

Identifier: NLB_INTERNAL_SCHEME_CHECK

Resource Types: AWS::ElasticLoadBalancingV2::LoadBalancer

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

nlb-listener-tagged

Checks if Network Load Balancer listeners have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: NLB_LISTENER_TAGGED

Resource Types: AWS::ElasticLoadBalancingV2::Listener

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

nlb-logging-enabled

Checks if access logging is enabled for Network Load Balancers. The rule is NON_COMPLIANT if access logging is not enabled for a Network Load balancer.

Identifier: NLB_LOGGING_ENABLED

Resource Types: AWS::ElasticLoadBalancingV2::LoadBalancer

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Asia Pacific (Taipei) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

nlb-tagged

Checks if Network Load Balancers have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: NLB_TAGGED

Resource Types: AWS::ElasticLoadBalancingV2::LoadBalancer

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

no-unrestricted-route-to-igw

Checks if there are public routes in the route table to an Internet gateway (IGW). The rule is NON_COMPLIANT if a route to an IGW has a destination CIDR block of '0.0.0.0/0' or '::/0' or if a destination CIDR block does not match the rule parameter.

Identifier: NO_UNRESTRICTED_ROUTE_TO_IGW

Resource Types: AWS::EC2::RouteTable

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

routeTableIds (Optional), Type: CSV

Comma-separated list of route table IDs that can have routes to an Internet Gateway with a destination CIDR block of '0.0.0.0/0' or '::/0'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

opensearchserverless-collection-description

Checks if Amazon OpenSearch Serverless collections have a description. The rule is NON_COMPLIANT if configuration.Description does not exist.

Identifier: OPENSEARCHSERVERLESS_COLLECTION_DESCRIPTION

Resource Types: AWS::OpenSearchServerless::Collection

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

opensearchserverless-collection-standbyreplicas-enabled

Checks if Amazon OpenSearch Serverless collections have standby replicas enabled. The rule is NON_COMPLIANT if configuration.StandbyReplicas is 'DISABLED'.

Identifier: OPENSEARCHSERVERLESS_COLLECTION_STANDBYREPLICAS_ENABLED

Resource Types: AWS::OpenSearchServerless::Collection

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

opensearch-access-control-enabled

Checks if Amazon OpenSearch Service domains have fine-grained access control enabled. The rule is NON_COMPLIANT if AdvancedSecurityOptions is not enabled for the OpenSearch Service domain.

Identifier: OPENSEARCH_ACCESS_CONTROL_ENABLED

Resource Types: AWS::OpenSearch::Domain

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

opensearch-audit-logging-enabled

Checks if Amazon OpenSearch Service domains have audit logging enabled. The rule is NON_COMPLIANT if an OpenSearch Service domain does not have audit logging enabled.

Identifier: OPENSEARCH_AUDIT_LOGGING_ENABLED

Resource Types: AWS::OpenSearch::Domain

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

cloudWatchLogsLogGroupArnList (Optional), Type: CSV

Comma-separated list of Amazon Resource Names (ARNs) for Amazon CloudWatch Logs log groups. The rule checks if the specified log groups are configured for audit logs.

Valid values include: `arn:aws:logs:region:account-id:log-group:log_group_name:*` and `arn:aws:logs:region:account-id:log-group:log_group_name`.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

opensearch-data-node-fault-tolerance

Checks if Amazon OpenSearch Service domains are configured with at least three data nodes and zoneAwarenessEnabled is true. The rule is NON_COMPLIANT for an OpenSearch domain if 'instanceCount' is less than 3 or 'zoneAwarenessEnabled' is set to 'false'.

Identifier: OPENSEARCH_DATA_NODE_FAULT_TOLERANCE

Resource Types: AWS::OpenSearch::Domain

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

opensearch-encrypted-at-rest

Checks if Amazon OpenSearch Service domains have encryption at rest configuration enabled. The rule is NON_COMPLIANT if the `EncryptionAtRestOptions` field is not enabled.

> **Note**
>
> The rule does not evaluate Elasticsearch domains.

Identifier: OPENSEARCH_ENCRYPTED_AT_REST

Resource Types: AWS::OpenSearch::Domain

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

opensearch-https-required

Checks whether connections to OpenSearch domains are using HTTPS. The rule is NON_COMPLIANT if the Amazon OpenSearch domain 'EnforceHTTPS' is not 'true' or is 'true' and 'TLSSecurityPolicy' is not in '`tlsPolicies`'.

Identifier: OPENSEARCH_HTTPS_REQUIRED

Resource Types: AWS::OpenSearch::Domain

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

tlsPolicies (Optional), Type: CSV

> Comma-separated list of TLS security policies to check against the Amazon OpensSearch domain.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

opensearch-in-vpc-only

Checks if Amazon OpenSearch Service domains are in an Amazon Virtual Private Cloud (VPC). The rule is NON_COMPLIANT if an OpenSearch Service domain endpoint is public.

> **Note**
>
> The rule does not evaluate Elasticsearch domains.

Identifier: OPENSEARCH_IN_VPC_ONLY

Resource Types: AWS::OpenSearch::Domain

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

opensearch-logs-to-cloudwatch

Checks if Amazon OpenSearch Service domains are configured to send logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if logging is not configured.

> **Note**
>
> The rule does not evaluate Elasticsearch domains.

Identifier: OPENSEARCH_LOGS_TO_CLOUDWATCH

Resource Types: AWS::OpenSearch::Domain

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

logTypes (Optional), Type: CSV

Comma-separated list of logs that are enabled. Valid values are 'search', 'index', 'error'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

opensearch-node-to-node-encryption-check

Check if Amazon OpenSearch Service nodes are encrypted end to end. The rule is NON_COMPLIANT if the node-to-node encryption is not enabled on the domain

> **Note**
>
> The rule does not evaluate Elasticsearch domains.

Identifier: OPENSEARCH_NODE_TO_NODE_ENCRYPTION_CHECK

Resource Types: AWS::OpenSearch::Domain

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

opensearch-primary-node-fault-tolerance

Checks if Amazon OpenSearch Service domains are configured with at least three dedicated primary nodes. The rule is NON_COMPLIANT for an OpenSearch Service domain if 'DedicatedMasterEnabled' is set to 'false', or 'DedicatedMasterCount' is less than 3.

Identifier: OPENSEARCH_PRIMARY_NODE_FAULT_TOLERANCE

Resource Types: AWS::OpenSearch::Domain

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

opensearch-update-check

Checks if Amazon OpenSearch Service version updates are available but not installed. The rule is NON_COMPLIANT for an OpenSearch domain if the latest software updates are not installed.

Identifier: OPENSEARCH_UPDATE_CHECK

Resource Types: AWS::OpenSearch::Domain

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico

(Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

panorama-package-tagged

Checks if AWS Panorama package resources have tags. Optionally, required tag keys can be specified. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: PANORAMA_PACKAGE_TAGGED

Resource Types: AWS::Panorama::Package

Trigger type: Configuration changes

AWS Region: Only available in Europe (Ireland), US East (N. Virginia), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rabbit-mq-supported-version

Checks if an Amazon MQ RabbitMQ broker is running on a specified minimum supported engine version. The rule is NON_COMPLIANT if the RabbitMQ broker is not running on the minimum supported engine version that you specify.

Identifier: RABBIT_MQ_SUPPORTED_VERSION

Resource Types: AWS::AmazonMQ::Broker

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

supportedEngineVersion, Type: String

> String value for the rule to check the minimum supported engine version for the RabbitMQ broker. RabbitMQ brokers use semantic versioning specification: X.Y.Z. X denotes the major version, Y represents the minor version, and Z denotes the patch version.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-aurora-mysql-audit-logging-enabled

Checks if Amazon Aurora MySQL-Compatible Edition clusters are configured to publish audit logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if Aurora MySQL-Compatible Edition clusters do not have audit log publishing configured.

Identifier: RDS_AURORA_MYSQL_AUDIT_LOGGING_ENABLED

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-aurora-postgresql-logs-to-cloudwatch

Checks if an Amazon Aurora PostgreSQL DB cluster is configured to publish PostgreSQL logs to Amazon CloudWatch Logs. This rule is NON_COMPLIANT if the DB cluster is not configured to publish PostgreSQL logs to Amazon CloudWatch Logs.

Identifier: RDS_AURORA_POSTGRESQL_LOGS_TO_CLOUDWATCH

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-automatic-minor-version-upgrade-enabled

Checks if Amazon Relational Database Service (RDS) database instances are configured for automatic minor version upgrades. The rule is NON_COMPLIANT if the value of

'autoMinorVersionUpgrade' is false. For Amazon Aurora clusters, automatic minor version upgrades require that all instances in the cluster and the cluster itself have this setting enabled; a COMPLIANT result on an individual instance does not guarantee upgrades will occur if the cluster level setting is not enabled. Additionally, this rule does not account for configurations where automatic minor version upgrades are unsupported, including Aurora clusters in a Global Database and Aurora MySQL clusters with cross-Region read replicas, which may receive evaluation results that do not accurately reflect upgrade behavior.

Identifier: RDS_AUTOMATIC_MINOR_VERSION_UPGRADE_ENABLED

Resource Types: AWS::RDS::DBInstance

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

Proactive Evaluation

For steps on how to run this rule in proactive mode, see Evaluating Your Resources with AWS Config Rules. For this rule to return COMPLIANT in proactive mode, the resource configuration schema for the StartResourceEvaluation API needs to include the following inputs, encoded as a string:

```
"ResourceConfiguration":
...
{
    "AutoMinorVersionUpgrade": BOOLEAN*,
    "Engine": String*
}
...
```

*For more information on valid values for these inputs, see AutoMinorVersionUpgrade and Engine in the AWS CloudFormation User Guide.

For more information on proactive evaluation, see Evaluation Mode.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-cluster-auto-minor-version-upgrade-enable

Checks if automatic minor version upgrades are enabled for Amazon RDS Multi-AZ cluster deployments. The rule is NON_COMPLIANT if autoMinorVersionUpgrade is set to false.

Identifier: RDS_CLUSTER_AUTO_MINOR_VERSION_UPGRADE_ENABLE

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), US West (N. California), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-cluster-backup-retention-check

Checks if an Amazon RDS cluster automated backup retention period is set to a specific number of days. The rule is NON_COMPLIANT if the retention period is less than the value specified by the parameter. The default value is 7 days.

Identifier: RDS_CLUSTER_BACKUP_RETENTION_CHECK

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), China (Ningxia) Region

Parameters:

minimumBackupRetentionPeriod (Optional), Type: int, Default: 7

> The minimum backup retention period in days for the rule to check. The rule is NON_COMPLIANT if the backup retention period is less than the value specified in this parameter. Valid values are 1 to 35. The default value is 7.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-cluster-default-admin-check

Checks if an Amazon Relational Database Service (Amazon RDS) database cluster has changed the admin username from its default value. The rule is NON_COMPLIANT if the admin username is set to the default value.

Identifier: RDS_CLUSTER_DEFAULT_ADMIN_CHECK

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), China (Ningxia) Region

Parameters:

validAdminUserNames (Optional), Type: CSV

> Comma-separated list of admin username(s) that Amazon RDS clusters can use. Cannot include 'postgres' or 'admin' as valid username(s) as these are default values.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-cluster-deletion-protection-enabled

Checks if an Amazon Relational Database Service (Amazon RDS) cluster has deletion protection enabled. This rule is NON_COMPLIANT if an RDS cluster does not have deletion protection enabled.

Identifier: RDS_CLUSTER_DELETION_PROTECTION_ENABLED

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-cluster-encrypted-at-rest

Checks if an Amazon Relational Database Service (Amazon RDS) cluster is encrypted at rest. The rule is NON_COMPLIANT if an Amazon RDS cluster is not encrypted at rest.

Identifier: RDS_CLUSTER_ENCRYPTED_AT_REST

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-cluster-iam-authentication-enabled

Checks if an Amazon Relational Database Service (Amazon RDS) cluster has AWS Identity and Access Management (IAM) authentication enabled. The rule is NON_COMPLIANT if an Amazon RDS Cluster does not have IAM authentication enabled.

Identifier: RDS_CLUSTER_IAM_AUTHENTICATION_ENABLED

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-cluster-multi-az-enabled

Checks if Amazon Aurora DB clusters have DB instances deployed across multiple Availability Zones. The rule is NON_COMPLIANT if the cluster's multiAZ property is false.

Identifier: RDS_CLUSTER_MULTI_AZ_ENABLED

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-cluster-snapshot-tagged

Checks if Amazon RDS cluster snapshots have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: RDS_CLUSTER_SNAPSHOT_TAGGED

Resource Types: AWS::RDS::DBClusterSnapshot

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Middle East (Bahrain), Middle East (UAE), AWS GovCloud (US-East), AWS GovCloud (US-West), Israel (Tel Aviv) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-cluster-tagged

Checks if Amazon RDS database clusters have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: RDS_CLUSTER_TAGGED

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Middle East (Bahrain), China (Beijing), Middle East (UAE), AWS GovCloud (US-East), AWS GovCloud (US-West) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-db-security-group-not-allowed

Checks if there are any Amazon Relational Database Service (Amazon RDS) DB security groups that are not the default DB security group. The rule is NON_COMPLIANT if there are any DB security groups that are not the default DB security group.

Identifier: RDS_DB_SECURITY_GROUP_NOT_ALLOWED

Resource Types: AWS::RDS::DBSecurityGroup

Trigger type: Configuration changes

AWS Region: Only available in Europe (Ireland), South America (Sao Paulo), US East (N. Virginia), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-enhanced-monitoring-enabled

Checks if enhanced monitoring is enabled for Amazon RDS instances. This rule is NON_COMPLIANT if '`monitoringInterval`' is '0' in the configuration item of the RDS instance, or if '`monitoringInterval`' does not match the rule parameter value.

Identifier: RDS_ENHANCED_MONITORING_ENABLED

Resource Types: AWS::RDS::DBInstance

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

monitoringInterval (Optional), Type: int

> An integer value in seconds between points when enhanced monitoring metrics are collected for the database instance. The valid values are 1, 5, 10, 15, 30, and 60.

Proactive Evaluation

For steps on how to run this rule in proactive mode, see Evaluating Your Resources with AWS Config Rules. For this rule to return COMPLIANT in proactive mode, the resource configuration schema for the StartResourceEvaluation API needs to include the following inputs, encoded as a string:

```
"ResourceConfiguration":
...
{
    "MonitoringInterval": Integer*,
    "Engine": String*
}
...
```

*For more information on valid values for these inputs, see MonitoringInterval and Engine in the AWS CloudFormation User Guide.

For more information on proactive evaluation, see Evaluation Mode.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-event-subscription-tagged

Checks if Amazon RDS event subscriptions have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: RDS_EVENT_SUBSCRIPTION_TAGGED

Resource Types: AWS::RDS::EventSubscription

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-global-cluster-aurora-mysql-supported-version

Checks if an Amazon Aurora MySQL global database is running on a specified minimum supported engine version. The rule is NON_COMPLIANT if the database is not running on the minimum supported engine version that you specify.

Identifier: RDS_GLOBAL_CLUSTER_AURORA_MYSQL_SUPPORTED_VERSION

Resource Types: AWS::RDS::GlobalCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

minSupportedEngineVersion, Type: String

String value for the minimum supported Aurora MySQL version for the aurora MySQL global database. Aurora MySQL database engine versions use the following syntax: 'mysql-major-version.mysql_aurora.aurora-mysql-version'. The 'mysql-major-version' portion represents the version of the client protocol and general level of MySQL feature support for the corresponding Aurora MySQL version. The 'aurora-mysql-version' part is a dotted value with three parts: the Aurora MySQL major version, the Aurora MySQL minor version, and the patch level.

longTermSupportVersion (Optional), Type: CSV

List of string values for Aurora MySQL versions that will have long-term support and are acceptable for use. Amazon Aurora MySQL global databases using an Aurora MySQL version specified in this parameter will be marked COMPLIANT. Aurora MySQL database engine versions use the following syntax: 'mysql-major-version.mysql_aurora.aurora-mysql-version'. The 'mysql-major-version' portion represents the version of the client protocol and general level of MySQL feature support for the corresponding Aurora MySQL version. The 'aurora-mysql-version' part is a dotted value with three parts: the Aurora MySQL major version, the Aurora MySQL minor version, and the patch level.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-global-cluster-aurora-postgresql-supported-version

Checks if an Amazon Aurora PostgreSQL global database is running on a specified minimum supported engine version. The rule is NON_COMPLIANT if the Aurora PostgreSQL global database is not running on the minimum supported engine version that you specify.

Identifier: RDS_GLOBAL_CLUSTER_AURORA_POSTGRESQL_SUPPORTED_VERSION

Resource Types: AWS::RDS::GlobalCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Middle East (Bahrain), China (Beijing), Middle East (UAE), AWS GovCloud (US-East), AWS GovCloud (US-West), China (Ningxia) Region

Parameters:

minSupportedEngineVersion, Type: String

String value for the rule to check the minimum supported engine version for the Aurora PostgreSQL global database. PostgreSQL database engine versions use a major.minor numbering scheme: X.Y. X denotes the major version, and Y represents the minor version.

longTermSupportVersion (Optional), Type: CSV

List of string values for Aurora PostgreSQL versions that will have long-term support and are acceptable for use. Amazon Aurora PostgreSQL global databases using an Aurora PostgreSQL version specified in this parameter will be marked COMPLIANT. Aurora PostgreSQL database engine versions use a major.minor numbering scheme: X.Y. X denotes the major version, and Y represents the minor version.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-instance-default-admin-check

Checks if an Amazon Relational Database Service (Amazon RDS) database has changed the admin username from its default value. This rule will only run on RDS database instances. The rule is NON_COMPLIANT if the admin username is set to the default value.

Identifier: RDS_INSTANCE_DEFAULT_ADMIN_CHECK

Resource Types: AWS::RDS::DBInstance

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

validAdminUserNames (Optional), Type: CSV

> Comma-separated list of admin username(s) that Amazon RDS instances can use. (Cannot include 'postgres' or 'admin' as valid username(s) as these are default values.)

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-instance-deletion-protection-enabled

Checks if an Amazon Relational Database Service (Amazon RDS) instance has deletion protection enabled. The rule is NON_COMPLIANT if an Amazon RDS instance does not have deletion protection enabled; for example, deletionProtection is set to false.

> **Warning**
>
> Some RDS DB instances within a Cluster (Aurora/DocumentDB) will show as not applicable because deletion protection is set at the cluster level.

Identifier: RDS_INSTANCE_DELETION_PROTECTION_ENABLED

Resource Types: AWS::RDS::DBInstance

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

databaseEngines (Optional), Type: CSV

Comma-separated list of RDS database engines to include in the evaluation of the rule. For example, 'mysql, postgres, mariadb'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-instance-iam-authentication-enabled

Checks if an Amazon Relational Database Service (Amazon RDS) instance has AWS Identity and Access Management (IAM) authentication enabled. The rule is NON_COMPLIANT if an Amazon RDS instance does not have IAM authentication enabled.

> **Note**
>
> The DB Engine should be one of 'mysql', 'postgres', 'aurora', 'aurora-mysql', or 'aurora-postgresql'. The DB instance status should be one of 'available', 'backing-up', 'storage-optimization', or 'storage-full'.

Identifier: RDS_INSTANCE_IAM_AUTHENTICATION_ENABLED

Resource Types: AWS::RDS::DBInstance

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-instance-public-access-check

Checks if the Amazon Relational Database Service (Amazon RDS) instances are not publicly accessible. The rule is NON_COMPLIANT if the publiclyAccessible field is true in the instance configuration item.

Identifier: RDS_INSTANCE_PUBLIC_ACCESS_CHECK

Resource Types: AWS::RDS::DBInstance

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

Proactive Evaluation

For steps on how to run this rule in proactive mode, see Evaluating Your Resources with AWS Config Rules. For this rule to return COMPLIANT in proactive mode, the resource configuration schema for the StartResourceEvaluation API needs to include the following inputs, encoded as a string:

```
"ResourceConfiguration":
...
{
   "PubliclyAccessible": BOOLEAN
}
```

```
...
```

For more information on proactive evaluation, see Evaluation Mode.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-instance-subnet-igw-check

Checks if RDS DB instances are deployed in a public subnet with a route to the internet gateway. The rule is NON_COMPLIANT if RDS DB instances is deployed in a public subnet

Identifier: RDS_INSTANCE_SUBNET_IGW_CHECK

Resource Types: AWS::RDS::DBInstance

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-integration-tagged

Checks if Amazon RDS integrations have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: RDS_INTEGRATION_TAGGED

Resource Types: AWS::RDS::Integration

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Middle East (Bahrain), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-in-backup-plan

Checks if Amazon Relational Database Service (Amazon RDS) databases are present in AWS Backup plans. The rule is NON_COMPLIANT if Amazon RDS databases are not included in any AWS Backup plan.

> **Note**
>
> The rule only applies to Amazon Aurora DB instances. DB clusters are not supported.

Identifier: RDS_IN_BACKUP_PLAN

Resource Types: AWS::RDS::DBInstance

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-last-backup-recovery-point-created

Checks if a recovery point was created for Amazon Relational Database Service (Amazon RDS). The rule is NON_COMPLIANT if the Amazon RDS instance does not have a corresponding recovery point created within the specified time period.

Identifier: RDS_LAST_BACKUP_RECOVERY_POINT_CREATED

Resource Types: AWS::RDS::DBInstance

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

recoveryPointAgeUnit (Optional), Type: String, Default: days

Unit of time for maximum allowed age. Accepted values: 'hours', 'days'.

recoveryPointAgeValue (Optional), Type: int, Default: 1

Numerical value for maximum allowed age. No more than 744 for hours, 31 for days.

resourceId (Optional), Type: String

ID of Amazon RDS instance for the rule to check.

resourceTags (Optional), Type: String

Tags of Amazon RDS instances for the rule to check, in JSON format `{"tagkey" : "tagValue"}`.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-logging-enabled

Checks if respective logs of Amazon Relational Database Service (Amazon RDS) are enabled. The rule is NON_COMPLIANT if any log types are not enabled.

> **Note**
>
> DB Instances that are not in 'available', 'backing-up', 'storage-optimization', or 'storage-full' status evaluate as `NOT_APPLICABLE`.

Identifier: RDS_LOGGING_ENABLED

Resource Types: AWS::RDS::DBInstance

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

additionalLogs (Optional), Type: StringMap

Comma-separated list of engine names and log type names. For example, "additionalLogs": "oracle: general, slowquery ; aurora: alert, slowquery"

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-mariadb-instance-encrypted-in-transit

Checks if connections to Amazon RDS for MariaDB DB instances with engine version greater than or equal to 10.5 use encryption in transit. The rule is NON_COMPLIANT if the DB parameter group is not in-sync or if require_secure_transport is not set to ON.

Identifier: RDS_MARIADB_INSTANCE_ENCRYPTED_IN_TRANSIT

Resource Types: AWS::RDS::DBInstance

Trigger type: Periodic

AWS Region: All supported AWS regions except Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-meets-restore-time-target

Checks if the restore time of Amazon Relational Database Service (Amazon RDS) instances meets specified duration. The rule is NON_COMPLIANT if LatestRestoreExecutionTimeMinutes of an Amazon RDS instance is greater than maxRestoreTime minutes.

Identifier: RDS_MEETS_RESTORE_TIME_TARGET

Resource Types: AWS::RDS::DBInstance

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

maxRestoreTime, Type: int

Numerical value for the maximum allowed restore runtime.

resourceId (Optional), Type: String

ID of Amazon RDS instance for the rule to check.

resourceTags (Optional), Type: String

Tags of Amazon RDS instances for the rule to check, in JSON format.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-multi-az-support

Checks whether high availability is enabled for your RDS DB instances.

In a Multi-AZ deployment, Amazon RDS automatically provisions and maintains a synchronous standby replica in a different Availability Zone. For more information, see High Availability (Multi-AZ) in the *Amazon RDS User Guide*.

> **Note**
>
> This rule does not evaluate Amazon Aurora DB, Amazon DocumentDB, and Amazon Neptune DB instances.

Identifier: RDS_MULTI_AZ_SUPPORT

Resource Types: AWS::RDS::DBInstance

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

Proactive Evaluation

For steps on how to run this rule in proactive mode, see Evaluating Your Resources with AWS Config Rules. For this rule to return COMPLIANT in proactive mode, the resource configuration schema for the StartResourceEvaluation API needs to include the following inputs, encoded as a string:

```
"ResourceConfiguration":
...
```

```
{
    "MultiAZ": BOOLEAN*,
    "Engine": String*
}
...
```

*For more information on valid values for these inputs, see MultiAZ and Engine in the AWS CloudFormation User Guide.

For more information on proactive evaluation, see Evaluation Mode.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-mysql-cluster-copy-tags-to-snapshot-check

Checks if Amazon Relational Database Service (Amazon RDS) MySQL DB clusters are configured to copy tags to snapshots. The rule is NON_COMPLIANT if an Amazon RDS MySQL DB cluster is not configured to copy tags to snapshots.

Identifier: RDS_MYSQL_CLUSTER_COPY_TAGS_TO_SNAPSHOT_CHECK

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), US West (N. California), Asia Pacific (Taipei) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-mysql-instance-encrypted-in-transit

Checks if connections to Amazon RDS for MySQL database instances are configured to use encryption in transit. The rule is NON_COMPLIANT if the associated database parameter group is not in-sync or if the require_secure_transport parameter is not set to 1.

> **Note**
>
> The rule returns `NOT_APPLICABLE` if the Amazon RDS instance is part of an RDS cluster.

Identifier: RDS_MYSQL_INSTANCE_ENCRYPTED_IN_TRANSIT

Resource Types: AWS::RDS::DBInstance

Trigger type: Periodic

AWS Region: All supported AWS regions except Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-option-group-tagged

Checks if Amazon RDS option group resources have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: RDS_OPTION_GROUP_TAGGED

Resource Types: AWS::RDS::OptionGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-oracle-optiongroup-enhanced-monitoring-enabled

Checks if Amazon RDS Oracle option groups have enhanced monitoring enabled. The rule is NON_COMPLIANT if configuration.item.OptionName is not equal to 'OEM_AGENT' or 'STATSPACK'.

Identifier: RDS_ORACLE_OPTIONGROUP_ENHANCED_MONITORING_ENABLED

Resource Types: AWS::RDS::OptionGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Middle East (Bahrain), Asia Pacific (Thailand), Middle East (UAE), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-pgsql-cluster-copy-tags-to-snapshot-check

Checks if Amazon Relational Database Service (Amazon RDS) PostgreSQL DB clusters are configured to copy tags to snapshots. The rule is NON_COMPLIANT if an RDS PostgreSQL DB cluster's CopyTagsToSnapshot property is set to false.

Identifier: RDS_PGSQL_CLUSTER_COPY_TAGS_TO_SNAPSHOT_CHECK

Resource Types: AWS::RDS::DBCluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), US West (N. California), Asia Pacific (Taipei) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-postgresql-logs-to-cloudwatch

Checks if an Amazon PostgreSQL DB instance is configured to publish logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if the DB instance is not configured to publish logs to Amazon CloudWatch Logs.

Identifier: RDS_POSTGRESQL_LOGS_TO_CLOUDWATCH

Resource Types: AWS::RDS::DBInstance

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Canada West (Calgary) Region

Parameters:

logTypes (Optional), Type: CSV

Comma-separated list of log types to be published to CloudWatch Logs. Valid values are: 'postgresql', 'upgrade'. Default value is 'postgresql'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-postgres-instance-encrypted-in-transit

Checks if connections to Amazon RDS PostgreSQL database instances are configured to use encryption in transit. The rule is NON_COMPLIANT if the associated database parameter group is not in-sync or if the rds.force_ssl parameter is not set to 1.

> **Note**
>
> The rule returns `NOT_APPLICABLE` if the Amazon RDS instance is part of an RDS cluster.

Identifier: RDS_POSTGRES_INSTANCE_ENCRYPTED_IN_TRANSIT

Resource Types: AWS::RDS::DBInstance

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-proxy-tls-encryption

Checks if Amazon RDS proxies enforce TLS for all connections. The rule is NON_COMPLIANT if an Amazon RDS proxy does not have TLS enforced for all connections.

Identifier: RDS_PROXY_TLS_ENCRYPTION

Resource Types: AWS::RDS::DBProxy

Trigger type: Periodic

AWS Region: All supported AWS regions except AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Taipei) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-resources-protected-by-backup-plan

Checks if Amazon Relational Database Service (Amazon RDS) instances are protected by a backup plan. The rule is NON_COMPLIANT if the Amazon RDS Database instance is not covered by a backup plan.

Identifier: RDS_RESOURCES_PROTECTED_BY_BACKUP_PLAN

Resource Types: AWS::RDS::DBInstance

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

backupVaultLockCheck (Optional), Type: String

Accepted values: 'True' or 'False'. Enter 'True' for the rule to check if the resource is backed up in a locked vault

crossAccountList (Optional), Type: String

Comma-separated list of destination accounts for cross-account backup copy to be kept

crossRegionList (Optional), Type: String

Comma-separated list of destination regions for the cross-region backup copy to be kept

maxRetentionDays (Optional), Type: int

The maximum retention period in days for the Backup Vault Lock

minRetentionDays (Optional), Type: int

The minimum retention period in days for the Backup Vault Lock

resourceId (Optional), Type: String

ID of Amazon RDS instance for the rule to check.

resourceTags (Optional), Type: String

Tags for Amazon RDS instances for the rule to check, in JSON format `{"tagkey" : "tagValue"}`.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-snapshots-public-prohibited

Checks if Amazon Relational Database Service (Amazon RDS) snapshots are public. The rule is NON_COMPLIANT if any existing and new Amazon RDS snapshots are public.

> **Note**
>
> It can take up to 12 hours for compliance results to be captured.

Identifier: RDS_SNAPSHOTS_PUBLIC_PROHIBITED

Resource Types: AWS::RDS::DBClusterSnapshot, AWS::RDS::DBSnapshot

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Africa (Cape Town), Asia Pacific (Melbourne), Europe (Milan), Israel (Tel Aviv), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-snapshot-encrypted

Checks if Amazon Relational Database Service (Amazon RDS) DB snapshots are encrypted. The rule is NON_COMPLIANT if the Amazon RDS DB snapshots are not encrypted.

Identifier: RDS_SNAPSHOT_ENCRYPTED

Resource Types: AWS::RDS::DBClusterSnapshot, AWS::RDS::DBSnapshot

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-sqlserver-encrypted-in-transit

Checks if connections to Amazon RDS SQL server database instances are configured to use encryption in transit. The rule is NON_COMPLIANT if the DB parameter force_ssl for the parameter group is not set to 1 or the ApplyStatus parameter is not 'in-sync'.

Identifier: RDS_SQLSERVER_ENCRYPTED_IN_TRANSIT

Resource Types: AWS::RDS::DBInstance

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-sql-server-logs-to-cloudwatch

Checks if an Amazon SQL Server DB instance is configured to publish logs to Amazon CloudWatch Logs. This rule is NON_COMPLIANT if the DB instance is not configured to publish logs to Amazon CloudWatch Logs.

Identifier: RDS_SQL_SERVER_LOGS_TO_CLOUDWATCH

Resource Types: AWS::RDS::DBInstance

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

logTypes (Optional), Type: CSV

logTypes - (Optional): Comma-separated list of log types to be published to CloudWatch Logs. Valid values are: 'error', 'agent'. Default value is 'error', 'agent'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rds-storage-encrypted

Checks if storage encryption is enabled for your Amazon Relational Database Service (Amazon RDS) DB instances. The rule is NON_COMPLIANT if storage encryption is not enabled.

Identifier: RDS_STORAGE_ENCRYPTED

Resource Types: AWS::RDS::DBInstance

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

kmsKeyId (Optional), Type: String

KMS key ID or Amazon Resource Name (ARN) used to encrypt the storage.

Proactive Evaluation

For steps on how to run this rule in proactive mode, see Evaluating Your Resources with AWS Config Rules. For this rule to return COMPLIANT in proactive mode, the resource configuration schema for the StartResourceEvaluation API needs to include the following inputs, encoded as a string:

```
"ResourceConfiguration":
...
{
```

```
   "StorageEncrypted": BOOLEAN
}
...
```

For more information on proactive evaluation, see Evaluation Mode.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

redshift-audit-logging-enabled

Checks if Amazon Redshift clusters are logging audits to a specific bucket. The rule is NON_COMPLIANT if audit logging is not enabled for a Redshift cluster or if the '`bucketNames`' parameter is provided but the audit logging destination does not match.

Identifier: REDSHIFT_AUDIT_LOGGING_ENABLED

Resource Types: AWS::Redshift::Cluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

bucketNames (Optional), Type: CSV

Comma-separated list of Amazon S3 bucket names for storing audit logs.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

redshift-backup-enabled

Checks that Amazon Redshift automated snapshots are enabled for clusters. The rule is NON_COMPLIANT if the value for `automatedSnapshotRetentionPeriod` is greater than `MaxRetentionPeriod` or less than `MinRetentionPeriod` or the value is 0.

Identifier: REDSHIFT_BACKUP_ENABLED

Resource Types: AWS::Redshift::Cluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Mexico (Central) Region

Parameters:

MaxRetentionPeriod (Optional), Type: int

Maximum value for the retention period. Maximum value is 35.

MinRetentionPeriod (Optional), Type: int

Minimum value for the retention period. Minimum value is 1.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

redshift-cluster-configuration-check

Checks if Amazon Redshift clusters have the specified settings. The rule is NON_COMPLIANT if the Amazon Redshift cluster is not encrypted or encrypted with another key, or if a cluster does not have audit logging enabled.

Identifier: REDSHIFT_CLUSTER_CONFIGURATION_CHECK

Resource Types: AWS::Redshift::Cluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Mexico (Central) Region

Parameters:

clusterDbEncrypted, Type: boolean, Default: true

Database encryption is enabled

loggingEnabled, Type: boolean, Default: true

Audit logging is enabled

nodeTypes (Optional), Type: CSV, Default: dc1.large

Specify node type

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

redshift-cluster-kms-enabled

Checks if Amazon Redshift clusters are using a specified AWS Key Management Service (AWS KMS) key for encryption. The rule is COMPLIANT if encryption is enabled and the cluster is encrypted with the key provided in the `kmsKeyArn` parameter. The rule is NON_COMPLIANT if the cluster is not encrypted or encrypted with another key.

Identifier: REDSHIFT_CLUSTER_KMS_ENABLED

Resource Types: AWS::Redshift::Cluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Mexico (Central) Region

Parameters:

kmsKeyArns (Optional), Type: CSV

Comma-separated list of AWS KMS key Amazon Resource Names (ARNs) used in Amazon Redshift clusters for encryption.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

redshift-cluster-maintenancesettings-check

Checks if Amazon Redshift clusters have the specified maintenance settings. The rule is NON_COMPLIANT if the automatic upgrades to major version is disabled.

Identifier: REDSHIFT_CLUSTER_MAINTENANCESETTINGS_CHECK

Resource Types: AWS::Redshift::Cluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Mexico (Central) Region

Parameters:

allowVersionUpgrade, Type: boolean, Default: true

Allow version upgrade is enabled.

automatedSnapshotRetentionPeriod (Optional), Type: int, Default: 1

Number of days to retain automated snapshots.

preferredMaintenanceWindow (Optional), Type: String

Scheduled maintenance window for clusters (for example, Mon:09:30-Mon:10:00).

Proactive Evaluation

For steps on how to run this rule in proactive mode, see Evaluating Your Resources with AWS Config Rules. For this rule to return COMPLIANT in proactive mode, the resource configuration schema for the StartResourceEvaluation API needs to include the following inputs, encoded as a string:

```
"ResourceConfiguration":
```

```
...
{
    "AutomatedSnapshotRetentionPeriod": Integer*,
    "PreferredMaintenanceWindow": String*,
    "AllowVersionUpgrade": BOOLEAN*
}
...
```

*For more information on valid values for these inputs, see AutomatedSnapshotRetentionPeriod, PreferredMaintenanceWindow, and AllowVersionUpgrade in the AWS CloudFormation User Guide.

For more information on proactive evaluation, see Evaluation Mode.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

redshift-cluster-multi-az-enabled

Checks if an Amazon Redshift cluster has multiple Availability Zones deployments enabled. This rule is NON_COMPLIANT if Amazon Redshift cluster does not have multiple Availability Zones deployments enabled.

Identifier: REDSHIFT_CLUSTER_MULTI_AZ_ENABLED

Resource Types: AWS::Redshift::Cluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Mexico (Central), US West (N. California) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

redshift-cluster-parameter-group-tagged

Checks if Amazon Redshift cluster parameter groups have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: REDSHIFT_CLUSTER_PARAMETER_GROUP_TAGGED

Resource Types: AWS::Redshift::ClusterParameterGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

redshift-cluster-public-access-check

Checks whether Amazon Redshift clusters are not publicly accessible. The rule is NON_COMPLIANT if the publiclyAccessible field is true in the cluster configuration item.

Identifier: REDSHIFT_CLUSTER_PUBLIC_ACCESS_CHECK

Resource Types: AWS::Redshift::Cluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Mexico (Central) Region

Parameters:

None

Proactive Evaluation

For steps on how to run this rule in proactive mode, see Evaluating Your Resources with AWS Config Rules. For this rule to return COMPLIANT in proactive mode, the resource configuration schema for the StartResourceEvaluation API needs to include the following inputs, encoded as a string:

```
"ResourceConfiguration":
...
{
   "PubliclyAccessible": BOOLEAN
}
...
```

For more information on proactive evaluation, see Evaluation Mode.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

redshift-cluster-subnet-group-multi-az

Checks If Amazon Redshift subnet groups contain subnets from more than one Availability Zone. The rule is NON_COMPLIANT if an Amazon Redshift subnet group does not contain subnets from at least two different Availability Zones.

Identifier: REDSHIFT_CLUSTER_SUBNET_GROUP_MULTI_AZ

Resource Types: AWS::Redshift::ClusterSubnetGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

redshift-default-admin-check

Checks if an Amazon Redshift cluster has changed the admin username from its default value. The rule is NON_COMPLIANT if the admin username for a Redshift cluster is set to “awsuser” or if the username does not match what is listed in parameter.

Identifier: REDSHIFT_DEFAULT_ADMIN_CHECK

Resource Types: AWS::Redshift::Cluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Canada West (Calgary) Region

Parameters:

validAdminUserNames (Optional), Type: CSV

> Comma-separated list of admin username(s) for Redshift clusters to use. Note: 'awsuser' is the default and not accepted.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

redshift-default-db-name-check

Checks if a Redshift cluster has changed its database name from the default value. The rule is NON_COMPLIANT if the database name for a Redshift cluster is set to “dev”, or if the optional parameter is provided and the database name does not match.

Identifier: REDSHIFT_DEFAULT_DB_NAME_CHECK

Resource Types: AWS::Redshift::Cluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

validDatabaseNames (Optional), Type: CSV

Comma-separated list of database name(s) for Redshift clusters.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

redshift-enhanced-vpc-routing-enabled

Checks if Amazon Redshift cluster has 'enhancedVpcRouting' enabled. The rule is NON_COMPLIANT if 'enhancedVpcRouting' is not enabled or if the configuration.enhancedVpcRouting field is 'false'.

Identifier: REDSHIFT_ENHANCED_VPC_ROUTING_ENABLED

Resource Types: AWS::Redshift::Cluster

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Mexico (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

redshift-require-tls-ssl

Checks if Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. The rule is NON_COMPLIANT if any Amazon Redshift cluster has parameter require_SSL not set to true.

Identifier: REDSHIFT_REQUIRE_TLS_SSL

Resource Types: AWS::Redshift::Cluster, AWS::Redshift::ClusterParameterGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Mexico (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

redshift-serverless-default-admin-check

Checks if an Amazon Redshift Serverless Namespace has changed the admin username from its default value. The rule is NON_COMPLIANT if the admin username for a Redshift Serverless Namespace is set to “admin”.

Identifier: REDSHIFT_SERVERLESS_DEFAULT_ADMIN_CHECK

Resource Types: AWS::RedshiftServerless::Namespace

Trigger type: Periodic

AWS Region: All supported AWS regions except Middle East (Bahrain), Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Melbourne), Europe (Milan), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

redshift-serverless-default-db-name-check

Checks if an Amazon Redshift Serverless namespace has changed its database name from the default value. The rule is NON_COMPLIANT if the database name for an Amazon Redshift Serverless namespace is set to `dev`.

Identifier: REDSHIFT_SERVERLESS_DEFAULT_DB_NAME_CHECK

Resource Types: AWS::RedshiftServerless::Namespace

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Middle East (Bahrain), Asia Pacific (Thailand), Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Europe (Milan), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

redshift-serverless-namespace-cmk-encryption

Checks if Amazon Redshift Serverless namespaces are encrypted by customer managed AWS KMS keys. The rule is NON_COMPLIANT if a namespace is not encrypted by a customer managed key. Optionally, you can specify a list of KMS keys for rule to check.

Identifier: REDSHIFT_SERVERLESS_NAMESPACE_CMK_ENCRYPTION

Resource Types: AWS::RedshiftServerless::Namespace

Trigger type: Periodic

AWS Region: All supported AWS regions except Middle East (Bahrain), Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Melbourne), Europe (Milan), Canada West (Calgary) Region

Parameters:

kmsKeyArns (Optional), Type: CSV

> Comma-separated list of Amazon Resource Names (ARNs) of customer managed keys for the rule to check. If provided, the rule is NON_COMPLIANT if an Amazon Redshift Serverless namespace is not encrypted with one of these KMS keys.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

redshift-serverless-publish-logs-to-cloudwatch

Checks if Amazon Redshift Serverless Namespace is configured to publish the following logs to Amazon CloudWatch Logs. This rule is NON_COMPLIANT if the Namespace is not configured to publish the following logs to Amazon CloudWatch Logs.

Identifier: REDSHIFT_SERVERLESS_PUBLISH_LOGS_TO_CLOUDWATCH

Resource Types: AWS::RedshiftServerless::Namespace

Trigger type: Periodic

AWS Region: All supported AWS regions except Middle East (Bahrain), Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Melbourne), Europe (Milan), AWS GovCloud (US-East), AWS GovCloud (US-West), Canada West (Calgary) Region

Parameters:

logType (Optional), Type: CSV

Comma-separated list of log types to be published to CloudWatch Logs. Valid values are 'connectionlog', 'userlog' Default value is 'connectionlog', 'userlog'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

redshift-serverless-workgroup-encrypted-in-transit

Checks if AWS Redshift Serverless workgroups have the require_ssl config parameter set to true. The rule is NON_COMPLIANT if require_ssl is set to false.

Identifier: REDSHIFT_SERVERLESS_WORKGROUP_ENCRYPTED_IN_TRANSIT

Resource Types: AWS::RedshiftServerless::Workgroup

Trigger type: Periodic

AWS Region: All supported AWS regions except Middle East (Bahrain), Africa (Cape Town), Middle East (UAE), South America (Sao Paulo), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Melbourne), Europe (Milan), AWS GovCloud (US-East), AWS GovCloud (US-West), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

redshift-serverless-workgroup-no-public-access

Checks if Amazon Redshift Serverless workgroups do not allow public access. The rule is NON_COMPLIANT if a workgroup has 'Turn on Public Accessible' enabled.

Identifier: REDSHIFT_SERVERLESS_WORKGROUP_NO_PUBLIC_ACCESS

Resource Types: AWS::RedshiftServerless::Workgroup

Trigger type: Periodic

AWS Region: All supported AWS regions except Middle East (Bahrain), Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Melbourne), Europe (Milan), AWS GovCloud (US-East), AWS GovCloud (US-West), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

redshift-serverless-workgroup-routes-within-vpc

Checks if Amazon Redshift Serverless workgroups route the network traffic through a VPC. The rule is NON_COMPLIANT if workgroups have 'Turn on Enhanced VPC routing' disabled.

Identifier: REDSHIFT_SERVERLESS_WORKGROUP_ROUTES_WITHIN_VPC

Resource Types: AWS::RedshiftServerless::Workgroup

Trigger type: Periodic

AWS Region: All supported AWS regions except Middle East (Bahrain), Africa (Cape Town), Middle East (UAE), South America (Sao Paulo), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Melbourne), Europe (Milan), AWS GovCloud (US-East), AWS GovCloud (US-West), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

redshift-unrestricted-port-access

Checks if security groups associated with an Amazon Redshift cluster have inbound rules that allow unrestricted incoming traffic. The rule is NON_COMPLIANT if there are inbound rules that allow unrestricted incoming traffic to the Redshift cluster port.

Identifier: REDSHIFT_UNRESTRICTED_PORT_ACCESS

Resource Types: AWS::Redshift::Cluster

Trigger type: Periodic

AWS Region: All supported AWS regions except China (Beijing), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

required-tags

Checks if your resources have the tags that you specify. For example, you can check whether your Amazon EC2 instances have the `CostCenter` tag, while also checking if all your RDS instance have one set of Keys tag. Separate multiple values with commas. You can check up to 6 tags at a time.

The AWS-managed AWS Systems Manager automation document `AWS-SetRequiredTags` does not work as a remediation with this rule. You will need to create your own custom Systems Manager automation documentation for remediation.

Context: AWS allows you to assign metadata to AWS resources in the form of tags. Each tag is a label consisting of a key and an optional value to store information about the resource or data retained on that resource. For more information see, Building your tagging strategy.

You can use this rule to find resources in your account that were not launched with your desired configurations by specifying which resources should have tags and the expected value for each tag. You can also run remediation actions to fix tagging mistakes. However, this rule does not prevent you from creating resources with incorrect tags.

> **Note**
>
> AWS Config does not support recording associated tags for all resource types. To verify if AWS Config records tags in the configuration item (CI) for a specific resource type:
>
> - Check that AWS Config correctly records the current configuration for the resource, excluding tags.
> - Check that AWS Config refreshes the recorded configuration when a change is made to the resource.

Identifier: REQUIRED_TAGS

Resource Types: AWS::ACM::Certificate, AWS::AutoScaling::AutoScalingGroup, AWS::CloudFormation::Stack, AWS::CodeBuild::Project, AWS::DynamoDB::Table, AWS::EC2::CustomerGateway, AWS::EC2::Instance, AWS::EC2::InternetGateway, AWS::EC2::NetworkAcl, AWS::EC2::NetworkInterface, AWS::EC2::RouteTable, AWS::EC2::SecurityGroup, AWS::EC2::Subnet, AWS::EC2::Volume, AWS::EC2::VPC, AWS::EC2::VPNConnection, AWS::EC2::VPNGateway, AWS::ElasticLoadBalancing::LoadBalancer, AWS::ElasticLoadBalancingV2::LoadBalancer, AWS::RDS::DBInstance, AWS::RDS::DBSecurityGroup, AWS::RDS::DBSnapshot, AWS::RDS::DBSubnetGroup, AWS::RDS::EventSubscription, AWS::Redshift::Cluster, AWS::Redshift::ClusterParameterGroup, AWS::Redshift::ClusterSecurityGroup, AWS::Redshift::ClusterSnapshot, AWS::Redshift::ClusterSubnetGroup, AWS::S3::Bucket

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

tag1Key, Type: String, Default: CostCenter

Key of the required tag.

tag1Value (Optional), Type: CSV

Optional value of the required tag. Separate multiple values with commas.

tag2Key (Optional), Type: String

Key of a second required tag.

tag2Value (Optional), Type: CSV

Optional value of the second required tag. Separate multiple values with commas.

tag3Key (Optional), Type: String

Key of a third required tag.

tag3Value (Optional), Type: CSV

Optional value of the third required tag. Separate multiple values with commas.

tag4Key (Optional), Type: String

Key of a fourth required tag.

tag4Value (Optional), Type: CSV

Optional value of the fourth required tag. Separate multiple values with commas.

tag5Key (Optional), Type: String

Key of a fifth required tag.

tag5Value (Optional), Type: CSV

Optional value of the fifth required tag. Separate multiple values with commas.

tag6Key (Optional), Type: String

Key of a sixth required tag.

tag6Value (Optional), Type: CSV

Optional value of the sixth required tag. Separate multiple values with commas.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

resiliencehub-app-tagged

Checks if AWS Resilience Hub app resources have tags. Optionally, required tag keys can be specified. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: RESILIENCEHUB_APP_TAGGED

Resource Types: AWS::ResilienceHub::App

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

resiliencehub-resiliencypolicy-tagged

Checks if AWS Resilience Hub policy resources have tags. Optionally, required tag keys can be specified. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: RESILIENCEHUB_RESILIENCYPOLICY_TAGGED

Resource Types: AWS::ResilienceHub::ResiliencyPolicy

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

restricted-common-ports

> **Important**
>
> For this rule, the rule identifier (RESTRICTED_INCOMING_TRAFFIC) and rule name (restricted-common-ports) are different.

Checks if the security groups in use do not allow unrestricted incoming Transmission Control Protocol (TCP) traffic to specified ports. The rule is COMPLIANT if:

- Port access is blocked to all TCP traffic.
- Port access is open to TCP traffic through Inbound rules, where the source is either a single IPv4 address or a range of IPv4 addresses in CIDR notation which does not cover all IPv4 addresses ("0.0.0.0/0").
- Port access is open to TCP traffic through Inbound rules, where the source is either a single IPv6 address or a range of IPv6 addresses in CIDR notation which does not cover all IPv6 addresses ("::/0)").

The rule is NON_COMPLIANT if IP addresses for inbound TCP connections are not restricted to specified ports.

Identifier: RESTRICTED_INCOMING_TRAFFIC

Resource Types: AWS::EC2::SecurityGroup

Trigger type: Configuration changes and Periodic

AWS Region: All supported AWS regions

Parameters:

blockedPort1 (Optional), Type: int, Default: 20

Blocked TCP port number. The default of 20 corresponds to File Transfer Protocol (FTP) Data Transfer.

blockedPort2 (Optional), Type: int, Default: 21

Blocked TCP port number. The default of 21 corresponds to File Transfer Protocol (FTP) Command Control.

blockedPort3 (Optional), Type: int, Default: 3389

Blocked TCP port number. The default of 3389 corresponds to Remote Desktop Protocol (RDP).

blockedPort4 (Optional), Type: int, Default: 3306

Blocked TCP port number. The default of 3306 corresponds to MySQL protocol.

blockedPort5 (Optional), Type: int, Default: 4333

Blocked TCP port number. Used for a specific port relevant for your environment.

blockedPorts (Optional), Type: CSV

Comma-separated list of blocked TCP port numbers. For example: 20, 21, 3306, 3389.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

root-account-hardware-mfa-enabled

Checks if your AWS account is enabled to use multi-factor authentication (MFA) hardware device to sign in with root credentials. The rule is NON_COMPLIANT if any virtual MFA devices are permitted for signing in with root credentials.

> **Note**
>
> **Not Applicable for Accounts Without Root User Credentials**
> This rule returns `NOT_APPLICABLE` if root user credentials are not present.
> **Managed Rules and Global IAM Resource Types**
> The global IAM resource types onboarded before February 2022 (`AWS::IAM::Group`, `AWS::IAM::Policy`, `AWS::IAM::Role`, and `AWS::IAM::User`) can only be recorded by AWS Config in AWS Regions where AWS Config was available before February 2022. These resource types cannot be recorded in Regions supported by AWS Config after February 2022. For a list of those Regions, see Recording AWS Resources | Global Resources.
> If you record a global IAM resource type in at least one Region, periodic rules that report compliance on the global IAM resource type will run evaluations in all Regions where the periodic rule is added, even if you have not enabled the recording of the global IAM resource type in the Region where the periodic rule was added.
> To avoid unnecessary evaluations, you should only deploy periodic rules that report compliance on a global IAM resource type to one of the supported Regions. For a list of which managed rules are supported in which Regions, see List of AWS Config Managed Rules by Region Availability.

Identifier: ROOT_ACCOUNT_HARDWARE_MFA_ENABLED

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

root-account-mfa-enabled

Checks if the root user of your AWS account requires multi-factor authentication for console sign-in. The rule is NON_COMPLIANT if the AWS Identity and Access Management (IAM) root account user does not have multi-factor authentication (MFA) enabled.

> **Note**
>
> **Not Applicable for Accounts Without Root User Credentials**
> This rule returns `NOT_APPLICABLE` if root user credentials are not present.
> **Managed Rules and Global IAM Resource Types**
> The global IAM resource types onboarded before February 2022 (`AWS::IAM::Group`, `AWS::IAM::Policy`, `AWS::IAM::Role`, and `AWS::IAM::User`) can only be recorded by AWS Config in AWS Regions where AWS Config was available before February 2022. These resource types cannot be recorded in Regions supported by AWS Config after February 2022. For a list of those Regions, see Recording AWS Resources | Global Resources.
> If you record a global IAM resource type in at least one Region, periodic rules that report compliance on the global IAM resource type will run evaluations in all Regions where the periodic rule is added, even if you have not enabled the recording of the global IAM resource type in the Region where the periodic rule was added.
> To avoid unnecessary evaluations, you should only deploy periodic rules that report compliance on a global IAM resource type to one of the supported Regions. For a list of which managed rules are supported in which Regions, see List of AWS Config Managed Rules by Region Availability.

Identifier: ROOT_ACCOUNT_MFA_ENABLED

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

route53-health-check-tagged

Checks if Amazon Route 53 health checks have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: ROUTE53_HEALTH_CHECK_TAGGED

Resource Types: AWS::Route53::HealthCheck

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

route53-hosted-zone-tagged

Checks if Amazon Route 53 hosted zones have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: ROUTE53_HOSTED_ZONE_TAGGED

Resource Types: AWS::Route53::HostedZone

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

route53-query-logging-enabled

Checks if DNS query logging is enabled for your Amazon Route 53 public hosted zones. The rule is NON_COMPLIANT if DNS query logging is not enabled for your Amazon Route 53 public hosted zones.

Identifier: ROUTE53_QUERY_LOGGING_ENABLED

Resource Types: AWS::Route53::HostedZone

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

route53-recovery-control-cluster-tagged

Checks if Amazon Route 53 Recovery Control clusters have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: ROUTE53_RECOVERY_CONTROL_CLUSTER_TAGGED

Resource Types: AWS::Route53RecoveryControl::Cluster

Trigger type: Configuration changes

AWS Region: Only available in US West (Oregon) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

route53-recovery-readiness-cell-tagged

Checks if Amazon Route 53 Recovery Readiness cells have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: ROUTE53_RECOVERY_READINESS_CELL_TAGGED

Resource Types: AWS::Route53RecoveryReadiness::Cell

Trigger type: Configuration changes

AWS Region: Only available in US West (Oregon) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

route53-recovery-readiness-readiness-check-tagged

Checks if Amazon Route 53 Recovery Readiness readiness checks have tags. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: ROUTE53_RECOVERY_READINESS_READINESS_CHECK_TAGGED

Resource Types: AWS::Route53RecoveryReadiness::ReadinessCheck

Trigger type: Configuration changes

AWS Region: Only available in US West (Oregon) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

route53-recovery-readiness-recovery-group-tagged

Checks if Amazon Route 53 Recovery Readiness recovery groups have tags. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: ROUTE53_RECOVERY_READINESS_RECOVERY_GROUP_TAGGED

Resource Types: AWS::Route53RecoveryReadiness::RecoveryGroup

Trigger type: Configuration changes

AWS Region: Only available in US West (Oregon) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

route53-recovery-readiness-resource-set-tagged

Checks if Amazon Route 53 Recovery Readiness resource sets have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: ROUTE53_RECOVERY_READINESS_RESOURCE_SET_TAGGED

Resource Types: AWS::Route53RecoveryReadiness::ResourceSet

Trigger type: Configuration changes

AWS Region: Only available in US West (Oregon) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

route53-resolver-firewall-domain-list-tagged

Checks if Amazon Route 53 Resolver firewall domain lists have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: ROUTE53_RESOLVER_FIREWALL_DOMAIN_LIST_TAGGED

Resource Types: AWS::Route53Resolver::FirewallDomainList

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

route53-resolver-firewall-rule-group-association-tagged

Checks if Amazon Route 53 Resolver firewall rule group associations have tags. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: ROUTE53_RESOLVER_FIREWALL_RULE_GROUP_ASSOCIATION_TAGGED

Resource Types: AWS::Route53Resolver::FirewallRuleGroupAssociation

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

route53-resolver-firewall-rule-group-tagged

Checks if Amazon Route 53 Resolver firewall rule groups have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: ROUTE53_RESOLVER_FIREWALL_RULE_GROUP_TAGGED

Resource Types: AWS::Route53Resolver::FirewallRuleGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

route53-resolver-resolver-endpoint-tagged

Checks if Amazon Route 53 Resolver resolver endpoints have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: ROUTE53_RESOLVER_RESOLVER_ENDPOINT_TAGGED

Resource Types: AWS::Route53Resolver::ResolverEndpoint

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

route53-resolver-resolver-rule-tagged

Checks if Amazon Route 53 Resolver resolver rules have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: ROUTE53_RESOLVER_RESOLVER_RULE_TAGGED

Resource Types: AWS::Route53Resolver::ResolverRule

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rum-app-monitor-cloudwatch-logs-enabled

Checks if Amazon CloudWatch RUM app monitors have CloudWatch logs enabled. The rule is NON_COMPLIANT if configuration.CwLogEnabled is false.

Identifier: RUM_APP_MONITOR_CLOUDWATCH_LOGS_ENABLED

Resource Types: AWS::RUM::AppMonitor

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

rum-app-monitor-tagged

Checks if Amazon CloudWatch RUM app monitors have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: RUM_APP_MONITOR_TAGGED

Resource Types: AWS::RUM::AppMonitor

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3express-dir-bucket-lifecycle-rules-check

Checks if lifecycle rules are configured for an Amazon S3 Express directory bucket. The rule is NON_COMPLIANT if there is no active lifecycle configuration rules or the configuration does not match with the parameter values.

Identifier: S3EXPRESS_DIR_BUCKET_LIFECYCLE_RULES_CHECK

Resource Types: AWS::S3Express::DirectoryBucket

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), US East (Ohio), Europe (Ireland), US East (N. Virginia), Asia Pacific (Tokyo), US West (Oregon) Region

Parameters:

targetExpirationDays (Optional), Type: int

Number of days after creation when objects are deleted from Amazon S3 Express directory buckets.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-access-point-in-vpc-only

Checks if an Amazon S3 access point does not allow access from the internet (NetworkOrigin is VPC). The rule is NON_COMPLIANT if NetworkOrigin is Internet.

Identifier: S3_ACCESS_POINT_IN_VPC_ONLY

Resource Types: AWS::S3::AccessPoint

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-access-point-public-access-blocks

Checks if Amazon S3 access points have block public access settings enabled. The rule is NON_COMPLIANT if block public access settings are not enabled for S3 access points.

Identifier: S3_ACCESS_POINT_PUBLIC_ACCESS_BLOCKS

Resource Types: AWS::S3::AccessPoint

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Canada West (Calgary) Region

Parameters:

excludedAccessPoints (Optional), Type: CSV

Comma-separated list of names for allowed public Amazon S3 access points.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-account-level-public-access-blocks

Checks if the required public access block settings are configured from account level. The rule is only NON_COMPLIANT when the fields set below do not match the corresponding fields in the configuration item.

> **Note**
>
> If you are using this rule, ensure that S3 Block Public Access is enabled. The rule is change-triggered, so it will not be invoked unless S3 Block Public Access is enabled. If S3 Block Public Access is not enabled the rule returns INSUFFICIENT_DATA. This means that you still might have some public buckets. For more information about setting up S3 Block Public Access, see Blocking public access to your Amazon S3 storage.

Identifier: S3_ACCOUNT_LEVEL_PUBLIC_ACCESS_BLOCKS

Resource Types: AWS::S3::AccountPublicAccessBlock

Trigger type: Configuration changes (current status not checked, only evaluated when changes generate new events)

> **Note**
>
> This rule is only triggered by configuration changes for the specific region where the S3 endpoint is located. In all other regions, the rule is checked periodically. If a change was made in another region, there could be a delay before the rule returns NON_COMPLIANT.

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

BlockPublicAcls (Optional), Type: String, Default: True

BlockPublicAcls is enforced or not, default True

BlockPublicPolicy (Optional), Type: String, Default: True

BlockPublicPolicy is enforced or not, default True

IgnorePublicAcls (Optional), Type: String, Default: True

IgnorePublicAcls is enforced or not, default True

RestrictPublicBuckets (Optional), Type: String, Default: True

RestrictPublicBuckets is enforced or not, default True

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-account-level-public-access-blocks-periodic

Checks if the required public access block settings are configured at the account level. The rule is NON_COMPLIANT if the configuration item does not match one or more settings from parameters (or default).

Identifier: S3_ACCOUNT_LEVEL_PUBLIC_ACCESS_BLOCKS_PERIODIC

Resource Types: AWS::::Account

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

BlockPublicAcls (Optional), Type: String

BlockPublicAcls is enforced or not, default True

BlockPublicPolicy (Optional), Type: String

BlockPublicPolicy is enforced or not, default True

IgnorePublicAcls (Optional), Type: String

IgnorePublicAcls is enforced or not, default True

RestrictPublicBuckets (Optional), Type: String

RestrictPublicBuckets is enforced or not, default True

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-bucket-acl-prohibited

Checks if Amazon Simple Storage Service (Amazon S3) Buckets allow user permissions through access control lists (ACLs). The rule is NON_COMPLIANT if ACLs are configured for user access in Amazon S3 Buckets.

Identifier: S3_BUCKET_ACL_PROHIBITED

Resource Types: AWS::S3::Bucket

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-bucket-blacklisted-actions-prohibited

Checks if an Amazon Simple Storage Service (Amazon S3) bucket policy does not allow blocklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS

accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any `s3:GetBucket*` actions and `s3:DeleteObject` on any object in the bucket. The rule is NON_COMPLIANT if any blocklisted actions are allowed by the Amazon S3 bucket policy.

> **Note**
>
> The rule will only check for entities in the Principal property and does not take into account any conditionals under the Condition property in a policy

> **Note**
>
> If a single value in an S3 bucket policy (for example, one Resource or Condition value) contains more than five IAM policy variables, the rule can't evaluate that policy and returns NON_COMPLIANT, even if the policy would otherwise be compliant. To get an accurate evaluation, split any value that contains more than five policy variables so that each value contains five or fewer.

Identifier: S3_BUCKET_BLACKLISTED_ACTIONS_PROHIBITED

Resource Types: AWS::S3::Bucket

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

blacklistedActionPattern, Type: CSV

Comma-separated list of blacklisted action patterns, for example, s3:GetBucket* and s3:DeleteObject.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-bucket-cross-region-replication-enabled

Checks if you have enabled S3 Cross-Region Replication for your Amazon S3 buckets. The rule is NON_COMPLIANT if there are no replication rules enabled for Cross-Region Replication.

Identifier: S3_BUCKET_CROSS_REGION_REPLICATION_ENABLED

Resource Types: AWS::S3::Bucket

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-bucket-default-lock-enabled

Checks if the S3 bucket has lock enabled, by default. The rule is NON_COMPLIANT if the lock is not enabled.

Identifier: S3_BUCKET_DEFAULT_LOCK_ENABLED

Resource Types: AWS::S3::Bucket

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

mode (Optional), Type: String

mode: (optional): A mode parameter with valid values of GOVERNANCE or COMPLIANCE.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-bucket-level-public-access-prohibited

Checks if S3 buckets are publicly accessible. The rule is NON_COMPLIANT if an S3 bucket is not listed in the `excludedPublicBuckets` parameter and bucket level settings are public.

Identifier: S3_BUCKET_LEVEL_PUBLIC_ACCESS_PROHIBITED

Resource Types: AWS::S3::Bucket

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

excludedPublicBuckets (Optional), Type: CSV

Comma-separated list of known allowed public Amazon S3 bucket names.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-bucket-logging-enabled

Checks if logging is enabled for your S3 buckets. The rule is NON_COMPLIANT if logging is not enabled.

Identifier: S3_BUCKET_LOGGING_ENABLED

Resource Types: AWS::S3::Bucket

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

targetBucket (Optional), Type: String

Target S3 bucket for storing server access logs.

targetPrefix (Optional), Type: String

Prefix of the S3 bucket for storing server access logs.

Proactive Evaluation

For steps on how to run this rule in proactive mode, see Evaluating Your Resources with AWS Config Rules. For this rule to return COMPLIANT in proactive mode, the resource configuration schema for the StartResourceEvaluation API needs to include the following inputs, encoded as a string:

```
"ResourceConfiguration":
...
{
   "BucketName": "amzn-s3-demo-bucket",
   "LoggingConfiguration": {
         "DestinationBucketName": "amzn-s3-demo-destination-bucket",
         "LogFilePrefix":"my-log"
   }
}
...
```

For more information on proactive evaluation, see Evaluation Mode.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-bucket-mfa-delete-enabled

Checks if MFA Delete is enabled in the Amazon Simple Storage Service (Amazon S3) bucket versioning configuration. The rule is NON_COMPLIANT if MFA Delete is not enabled.

Identifier: S3_BUCKET_MFA_DELETE_ENABLED

Resource Types: AWS::S3::Bucket

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-bucket-policy-grantee-check

Checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or VPCs that you provide. The rule is COMPLIANT if a bucket policy is not present.

For example, if the input parameter to the rule is the list of two principals: `111122223333` and `444455556666` and the bucket policy specifies that only `111122223333` can access the bucket, then the rule is COMPLIANT. With the same input parameters: If the bucket policy specifies that `111122223333` and `444455556666` can access the bucket, it is also COMPLIANT.

However, if the bucket policy specifies that `999900009999` can access the bucket, the rule is NON_COMPLIANT.

> **Note**
>
> If a bucket policy contains more than one statement, each statement in the bucket policy is evaluated against this rule.

> **Note**
>
> If a single value in an S3 bucket policy (for example, one Resource or Condition value) contains more than five IAM policy variables, the rule can't evaluate that policy and returns

NON_COMPLIANT, even if the policy would otherwise be compliant. To get an accurate evaluation, split any value that contains more than five policy variables so that each value contains five or fewer.

Identifier: S3_BUCKET_POLICY_GRANTEE_CHECK

Resource Types: AWS::S3::Bucket

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

awsPrincipals (Optional), Type: CSV

Comma-separated list of principals such as IAM User ARNs, IAM Role ARNs, and AWS accounts. You must provide the full ARN or use partial matching. For example, "arn:aws:iam::*AccountID*:role/*role_name*" or "arn:aws:iam::*AccountID*:role/*". If the provided value is not an exact match with the principal ARN specified in the bucket policy, the rule is NON_COMPLIANT.

federatedUsers (Optional), Type: CSV

Comma-separated list of identity providers for web identity federation such as Amazon Cognito and SAML identity providers. For example 'cognito-identity.amazonaws.com, arn:aws:iam::111122223333:saml-provider/my-provider'.

ipAddresses (Optional), Type: CSV

Comma-separated list of CIDR formatted IP addresses, for example '10.0.0.1, 192.168.1.0/24, 2001:db8::/32'.

servicePrincipals (Optional), Type: CSV

Comma-separated list of service principals, for example 'cloudtrail.amazonaws.com, lambda.amazonaws.com'.

vpcIds (Optional), Type: CSV

Comma-separated list of Amazon Virtual Private Clouds (Amazon VPC) IDs, for example 'vpc-1234abc0, vpc-ab1234c0'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-bucket-policy-not-more-permissive

Checks if your Amazon Simple Storage Service bucket policies do not allow other inter-account permissions than the control Amazon S3 bucket policy that you provide.

> **Note**
>
> If you provide an invalid parameter value, you will see the following error: Value for controlPolicy parameter must be an Amazon S3 bucket policy.

> **Note**
>
> If a single value in an S3 bucket policy (for example, one Resource or Condition value) contains more than five IAM policy variables, the rule can't evaluate that policy and returns NON_COMPLIANT, even if the policy would otherwise be compliant. To get an accurate evaluation, split any value that contains more than five policy variables so that each value contains five or fewer.

Identifier: S3_BUCKET_POLICY_NOT_MORE_PERMISSIVE

Resource Types: AWS::S3::Bucket

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

controlPolicy, Type: String

Amazon S3 bucket policy that defines an upper bound on the permissions of your S3 buckets. The policy can be a maximum of 1024 characters long.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-bucket-public-read-prohibited

Checks if your Amazon S3 buckets do not allow public read access. The rule checks the Block Public Access settings, the bucket policy, and the bucket access control list (ACL).

The rule is compliant when both of the following are true:

- The Block Public Access setting restricts public policies or the bucket policy does not allow public read access.
- The Block Public Access setting restricts public ACLs or the bucket ACL does not allow public read access.

The rule is noncompliant when:

- If the Block Public Access setting does not restrict public policies, AWS Config evaluates whether the policy allows public read access. If the policy allows public read access, the rule is noncompliant.
- If the Block Public Access setting does not restrict public bucket ACLs, AWS Config evaluates whether the bucket ACL allows public read access. If the bucket ACL allows public read access, the rule is noncompliant.

> **Note**
>
> To be considered non-public, an S3 bucket policy must grant access only to fixed values. This means a policy is NON_COMPLIANT if it grants access to a wildcard or the following IAM policy element: Variables. A fixed value containing a wildcard can still be COMPLIANT.

> **Note**
>
> If a single value in an S3 bucket policy (for example, one Resource or Condition value) contains more than five IAM policy variables, the rule can't evaluate that policy and returns

NON_COMPLIANT, even if the policy would otherwise be compliant. To get an accurate evaluation, split any value that contains more than five policy variables so that each value contains five or fewer.

Identifier: S3_BUCKET_PUBLIC_READ_PROHIBITED

Resource Types: AWS::S3::Bucket

Trigger type: Configuration changes and Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-bucket-public-write-prohibited

Checks if your Amazon S3 buckets do not allow public write access. The rule checks the Block Public Access settings, the bucket policy, and the bucket access control list (ACL).

The rule is compliant when both of the following are true:

- The Block Public Access setting restricts public policies or the bucket policy does not allow public write access.
- The Block Public Access setting restricts public ACLs or the bucket ACL does not allow public write access.

The rule is noncompliant when:

- If the Block Public Access setting does not restrict public policies, AWS Config evaluates whether the policy allows public write access. If the policy allows public write access, the rule is noncompliant.

- If the Block Public Access setting does not restrict public bucket ACLs, AWS Config evaluates whether the bucket ACL allows public write access. If the bucket ACL allows public write access, the rule is noncompliant.

> **Note**
>
> This rule does not evaluate changes to account level public block access. To check if the required public access block settings are configured from the account level, see s3-account-level-public-access-blocks and s3-account-level-public-access-blocks-periodic.

> **Note**
>
> To be considered non-public, an S3 bucket policy must grant access only to fixed values. This means a policy is NON_COMPLIANT if it grants access to a wildcard or the following IAM policy element: Variables. A fixed value containing a wildcard can still be COMPLIANT.

> **Note**
>
> If a single value in an S3 bucket policy (for example, one Resource or Condition value) contains more than five IAM policy variables, the rule can't evaluate that policy and returns NON_COMPLIANT, even if the policy would otherwise be compliant. To get an accurate evaluation, split any value that contains more than five policy variables so that each value contains five or fewer.

Identifier: S3_BUCKET_PUBLIC_WRITE_PROHIBITED

Resource Types: AWS::S3::Bucket

Trigger type: Configuration changes and Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-bucket-replication-enabled

Checks if S3 buckets have replication rules enabled. The rule is NON_COMPLIANT if an S3 bucket does not have a replication rule or has a replication rule that is not enabled.

Identifier: S3_BUCKET_REPLICATION_ENABLED

Resource Types: AWS::S3::Bucket

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

ReplicationType (Optional), Type: String

Accepted values: 'CROSS-REGION' and 'SAME-REGION'. Enter 'CROSS-REGION' for the rule to check that all buckets have only Cross-Region Replication enabled. Enter 'SAME-REGION' for the rule to check that all buckets have only Same-Region Replication enabled.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-bucket-server-side-encryption-enabled

Checks if your Amazon S3 bucket either has the Amazon S3 default encryption enabled or that the Amazon S3 bucket policy explicitly denies `put-object` requests without server side encryption that uses AES-256 or AWS Key Management Service. The rule is NON_COMPLIANT if your Amazon S3 bucket is not encrypted by default.

> **Note**
>
> If a single value in an S3 bucket policy (for example, one Resource or Condition value) contains more than five IAM policy variables, the rule can't evaluate that policy and returns

NON_COMPLIANT, even if the policy would otherwise be compliant. To get an accurate evaluation, split any value that contains more than five policy variables so that each value contains five or fewer.

Identifier: S3_BUCKET_SERVER_SIDE_ENCRYPTION_ENABLED

Resource Types: AWS::S3::Bucket

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-bucket-ssl-requests-only

Checks if S3 buckets have policies that require requests to use SSL/TLS. The rule is NON_COMPLIANT if any S3 bucket has policies allowing HTTP requests.

> **Note**
>
> If a single value in an S3 bucket policy (for example, one Resource or Condition value) contains more than five IAM policy variables, the rule can't evaluate that policy and returns NON_COMPLIANT, even if the policy would otherwise be compliant. To get an accurate evaluation, split any value that contains more than five policy variables so that each value contains five or fewer.

Identifier: S3_BUCKET_SSL_REQUESTS_ONLY

Resource Types: AWS::S3::Bucket

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-bucket-tagged

Checks if Amazon S3 buckets have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: S3_BUCKET_TAGGED

Resource Types: AWS::S3::Bucket

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-bucket-versioning-enabled

Checks if versioning is enabled for your S3 buckets. Optionally, the rule checks if MFA delete is enabled for your S3 buckets.

Identifier: S3_BUCKET_VERSIONING_ENABLED

Resource Types: AWS::S3::Bucket

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

isMfaDeleteEnabled (Optional), Type: String

MFA delete is enabled for your S3 buckets.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-default-encryption-kms

Checks if the S3 buckets are encrypted with AWS Key Management Service (AWS KMS). The rule is NON_COMPLIANT if the S3 bucket is not encrypted with an AWS KMS key.

Identifier: S3_DEFAULT_ENCRYPTION_KMS

Resource Types: AWS::S3::Bucket, AWS::KMS::Key

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

kmsKeyArns (Optional), Type: CSV

Comma separated list of AWS KMS key ARNs allowed for encrypting Amazon S3 Buckets.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-directory-bucket-lifecycle-policy-rule-check

Checks if directory buckets for Amazon S3 have a lifecycle policy with at least one enabled rule. The rule is NON_COMPLIANT if there are no lifecycle policy rules or if none of the lifecycle policy rules have status Enabled.

Identifier: S3_DIRECTORY_BUCKET_LIFECYCLE_POLICY_RULE_CHECK

Resource Types: AWS::S3Express::DirectoryBucket

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), US East (Ohio), Europe (Ireland), US East (N. Virginia), Asia Pacific (Tokyo), US West (Oregon) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-event-notifications-enabled

Checks if Amazon S3 Events Notifications are enabled on an S3 bucket. The rule is NON_COMPLIANT if S3 Events Notifications are not set on a bucket, or if the event type or destination do not match the `eventTypes` and destinationArn parameters.

Identifier: S3_EVENT_NOTIFICATIONS_ENABLED

Resource Types: AWS::S3::Bucket

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Mexico (Central) Region

Parameters:

destinationArn (Optional), Type: String

The Amazon Resource Name (ARN) of the destination for the event notification (Amazon SNS topic, AWS Lambda, Amazon SQS Queue).

eventTypes (Optional), Type: CSV

Comma-separated list of the preferred Amazon S3 event types

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-last-backup-recovery-point-created

Checks if a recovery point was created for Amazon Simple Storage Service (Amazon S3). The rule is NON_COMPLIANT if the Amazon S3 bucket does not have a corresponding recovery point created within the specified time period.

Identifier: S3_LAST_BACKUP_RECOVERY_POINT_CREATED

Resource Types: AWS::S3::Bucket

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

recoveryPointAgeUnit (Optional), Type: String, Default: days

Unit of time for maximum allowed age. Accepted values: 'hours', 'days'.

recoveryPointAgeValue (Optional), Type: int, Default: 1

Numerical value for maximum allowed age. No more than 744 for hours, 31 for days.

resourceId (Optional), Type: String

Name of Amazon S3 bucket for the rule to check.

resourceTags (Optional), Type: String

Tags of Amazon S3 bucket for the rule to check, in JSON format `{"tagkey" : "tagValue"}`.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-lifecycle-policy-check

Checks if a lifecycle rule is configured for an Amazon Simple Storage Service (Amazon S3) bucket. The rule is NON_COMPLIANT if there is no active lifecycle configuration rules or the configuration does not match with the parameter values.

Identifier: S3_LIFECYCLE_POLICY_CHECK

Resource Types: AWS::S3::Bucket

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

bucketNames (Optional), Type: CSV

Comma-separated list of Amazon S3 bucket names that have lifecycle policy enabled.

targetExpirationDays (Optional), Type: int

Number of days after object creation when objects are deleted (for example, 395 days).

targetPrefix (Optional), Type: String

Amazon S3 Object prefix to identify one or more objects.

targetTransitionDays (Optional), Type: int

Number of days after object creation when objects are transitioned to a specified storage class (for example, 30 days).

targetTransitionStorageClass (Optional), Type: String

Destination storage class type. For example, Amazon S3 Standard-Infrequent Access (S3 Standard-IA). For more information, see Understanding and managing Amazon S3 storage classes.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-meets-restore-time-target

Checks if the restore time of Amazon Simple Storage Service (Amazon S3) buckets meets the specified duration. The rule is NON_COMPLIANT if LatestRestoreExecutionTimeMinutes of an Amazon S3 bucket is greater than maxRestoreTime minutes.

Identifier: S3_MEETS_RESTORE_TIME_TARGET

Resource Types: AWS::S3::Bucket

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

maxRestoreTime, Type: int

Numerical value for the maximum allowed restore runtime.

resourceId (Optional), Type: String

Name of Amazon S3 bucket for the rule to check.

resourceTags (Optional), Type: String

Tags of Amazon S3 bucket for the rule to check, in JSON format.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-resources-in-logically-air-gapped-vault

Checks if Amazon Simple Storage Service (Amazon S3) buckets are in a logically air-gapped vault. The rule is NON_COMPLIANT if an Amazon S3 bucket is not in a logically air-gapped vault within the specified time period.

Identifier: S3_RESOURCES_IN_LOGICALLY_AIR_GAPPED_VAULT

Resource Types: AWS::S3::Bucket

Trigger type: Periodic

AWS Region: Only available in Europe (Stockholm), Middle East (Bahrain), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Osaka), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

recoveryPointAgeUnit (Optional), Type: String, Default: days

Unit of time for maximum allowed age. Accepted values: 'hours', 'days'.

recoveryPointAgeValue (Optional), Type: int, Default: 1

Numerical value for maximum allowed age. No more than 2184 for hours, 91 for days.

resourceId (Optional), Type: String

Name of Amazon S3 bucket for the rule to check.

resourceTags (Optional), Type: String

Tags of Amazon S3 bucket for the rule to check, in JSON format.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-resources-protected-by-backup-plan

Checks if Amazon Simple Storage Service (Amazon S3) buckets are protected by a backup plan. The rule is NON_COMPLIANT if the Amazon S3 bucket is not covered by a backup plan.

Identifier: S3_RESOURCES_PROTECTED_BY_BACKUP_PLAN

Resource Types: AWS::S3::Bucket

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

backupVaultLockCheck (Optional), Type: String

Accepted values: 'True' or 'False'. Enter 'True' for the rule to check if the resource is backed up in a locked vault

crossAccountList (Optional), Type: String

Comma-separated list of destination accounts for cross-account backup copy to be kept

crossRegionList (Optional), Type: String

Comma-separated list of destination regions for the cross-region backup copy to be kept

maxRetentionDays (Optional), Type: int

The maximum retention period in days for the Backup Vault Lock

minRetentionDays (Optional), Type: int

The minimum retention period in days for the Backup Vault Lock

resourceId (Optional), Type: String

Name of Amazon S3 bucket for the rule to check.

resourceTags (Optional), Type: String

Tags for Amazon S3 buckets for the rule to check, in JSON format `{"tagkey" : "tagValue"}`.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

s3-version-lifecycle-policy-check

Checks if Amazon Simple Storage Service (Amazon S3) version enabled buckets have lifecycle policy configured. The rule is NON_COMPLIANT if Amazon S3 lifecycle policy is not enabled.

Identifier: S3_VERSION_LIFECYCLE_POLICY_CHECK

Resource Types: AWS::S3::Bucket

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

bucketNames (Optional), Type: CSV

Comma-separated list of Amazon S3 bucket names that have lifecycle policy enabled.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-app-image-config-tagged

Checks if Amazon SageMaker app image configs have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: SAGEMAKER_APP_IMAGE_CONFIG_TAGGED

Resource Types: AWS::SageMaker::AppImageConfig

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-data-quality-job-encrypt-in-transit

Checks if Amazon SageMaker data quality job definitions have inter-container traffic encryption enabled when the instance count is 2 or greater. The rule is NON_COMPLIANT if configuration.NetworkConfig.EnableInterContainerTrafficEncryption is false.

Identifier: SAGEMAKER_DATA_QUALITY_JOB_ENCRYPT_IN_TRANSIT

Resource Types: AWS::SageMaker::DataQualityJobDefinition

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Middle East (Bahrain), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Osaka), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-data-quality-job-isolation

Checks if Amazon SageMaker data quality job definitions have network isolation enabled. The rule is NON_COMPLIANT if configuration.NetworkConfig.EnableNetworkIsolation is false.

Identifier: SAGEMAKER_DATA_QUALITY_JOB_ISOLATION

Resource Types: AWS::SageMaker::DataQualityJobDefinition

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Middle East (Bahrain), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Osaka), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-domain-in-vpc

Checks if an Amazon SageMaker domain uses a customer owned Amazon Virtual Private Cloud (VPC) for non-EFS traffic. The rule is NON_COMPLIANT if configuration.AppNetworkAccessType is not set to VpcOnly.

Identifier: SAGEMAKER_DOMAIN_IN_VPC

Resource Types: AWS::SageMaker::Domain

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-domain-tagged

Checks if Amazon SageMaker domains have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: SAGEMAKER_DOMAIN_TAGGED

Resource Types: AWS::SageMaker::Domain

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-endpoint-configuration-kms-key-configured

Checks if AWS Key Management Service (AWS KMS) key is configured for an Amazon SageMaker endpoint configuration. The rule is NON_COMPLIANT if 'KmsKeyId' is not specified for the Amazon SageMaker endpoint configuration.

Identifier: SAGEMAKER_ENDPOINT_CONFIGURATION_KMS_KEY_CONFIGURED

Resource Types: AWS::SageMaker::EndpointConfig

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico (Central), Asia Pacific (Taipei) Region

Parameters:

kmsKeyArns (Optional), Type: String

Comma-separated list of specific AWS KMS key ARNs allowed for an Amazon SageMaker endpoint configuration.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-endpoint-config-kms-key-required

Checks whether SageMaker endpoint configurations are encrypted with a customer-managed KMS key. The rule is NON_COMPLIANT if KmsKeyId is not set on the endpoint configuration.

Identifier: SAGEMAKER_ENDPOINT_CONFIG_KMS_KEY_REQUIRED

Resource Types: AWS::SageMaker::EndpointConfig

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Middle East (Bahrain), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-endpoint-config-prod-instance-count

Checks if Amazon SageMaker endpoint configurations have production variants `InitialInstanceCount` set to a value greater than 1. The rule is NON_COMPLIANT if production variants `InitialInstanceCount` is equal to 1.

Identifier: SAGEMAKER_ENDPOINT_CONFIG_PROD_INSTANCE_COUNT

Resource Types: AWS::SageMaker::EndpointConfig

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-featuregroup-description

Checks if Amazon SageMaker FeatureGroup resources contain a description. The rule is NON_COMPLIANT if the FeatureGroup does not contain a description field or the description is empty.

Identifier: SAGEMAKER_FEATUREGROUP_DESCRIPTION

Resource Types: AWS::SageMaker::FeatureGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-featuregroup-encryption-at-rest

Checks if SageMaker feature groups have KMS encryption for OfflineStore. The rule is NON_COMPLIANT if offline store S3 storage does not have KMS key encryption.

Identifier: SAGEMAKER_FEATUREGROUP_ENCRYPTION_AT_REST

Resource Types: AWS::SageMaker::FeatureGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Middle East (Bahrain), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-featuregroup-online-store-encryption

Checks if SageMaker feature groups have KMS encryption for OnlineStore with standard storage. The rule is NON_COMPLIANT if KMS key encryption is not configured.

Identifier: SAGEMAKER_FEATUREGROUP_ONLINE_STORE_ENCRYPTION

Resource Types: AWS::SageMaker::FeatureGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Middle East (Bahrain), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-feature-group-tagged

Checks if Amazon SageMaker feature groups have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: SAGEMAKER_FEATURE_GROUP_TAGGED

Resource Types: AWS::SageMaker::FeatureGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-image-description

Checks if Amazon SageMaker images have a description. The rule is NON_COMPLIANT if configuration.ImageDescription does not exist.

Identifier: SAGEMAKER_IMAGE_DESCRIPTION

Resource Types: AWS::SageMaker::Image

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-image-tagged

Checks if Amazon SageMaker images have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: SAGEMAKER_IMAGE_TAGGED

Resource Types: AWS::SageMaker::Image

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-inferenceexperiment-tagged

Checks if Amazon SageMaker Inference Experiments have tags. Optionally, required tag keys can be specified. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: SAGEMAKER_INFERENCEEXPERIMENT_TAGGED

Resource Types: AWS::SageMaker::InferenceExperiment

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-inf-experiment-data-storage-kms-encrypted

Checks whether a SageMaker inference experiment with data capture enabled has a customer-managed KMS key for encrypting captured data at rest. The rule is NON_COMPLIANT if DataStorageConfig.KmsKey is not set or is empty.

Identifier: SAGEMAKER_INF_EXPERIMENT_DATA_STORAGE_KMS_ENCRYPTED

Resource Types: AWS::SageMaker::InferenceExperiment

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Middle East (Bahrain), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific

(Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-inf-experiment-instance-storage-kms-encrypted

Checks whether a SageMaker inference experiment is configured with a customer-managed AWS KMS key for instance storage volume encryption. The rule is NON_COMPLIANT if KmsKey is not set or is empty.

Identifier: SAGEMAKER_INF_EXPERIMENT_INSTANCE_STORAGE_KMS_ENCRYPTED

Resource Types: AWS::SageMaker::InferenceExperiment

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Middle East (Bahrain), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-model-bias-job-encrypt-in-transit

Checks if Amazon SageMaker model bias job definitions have inter-container traffic encryption enabled when the instance count is 2 or greater. The rule is NON_COMPLIANT if configuration.NetworkConfig.EnableInterContainerTrafficEncryption is false.

Identifier: SAGEMAKER_MODEL_BIAS_JOB_ENCRYPT_IN_TRANSIT

Resource Types: AWS::SageMaker::ModelBiasJobDefinition

Trigger type: Configuration changes

AWS Region: Only available in Middle East (Bahrain), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Osaka), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-model-bias-job-isolation

Checks if Amazon SageMaker model bias job definitions have network isolation enabled. The rule is NON_COMPLIANT if configuration.NetworkConfig.EnableNetworkIsolation is false.

Identifier: SAGEMAKER_MODEL_BIAS_JOB_ISOLATION

Resource Types: AWS::SageMaker::ModelBiasJobDefinition

Trigger type: Configuration changes

AWS Region: Only available in Middle East (Bahrain), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), Asia Pacific (Hong Kong),

US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Osaka), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-model-explainability-job-encrypt-in-transit

Checks if Amazon SageMaker model explainability job definitions have inter-container traffic encryption enabled when instance count is 2 or greater. The rule is NON_COMPLIANT if configuration.NetworkConfig.EnableInterContainerTrafficEncryption is false.

Identifier: SAGEMAKER_MODEL_EXPLAINABILITY_JOB_ENCRYPT_IN_TRANSIT

Resource Types: AWS::SageMaker::ModelExplainabilityJobDefinition

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Middle East (Bahrain), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Osaka), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-model-explainability-job-network-isolation

Checks whether an Amazon SageMaker model explainability job definition has network isolation enabled. The rule is NON_COMPLIANT if NetworkConfig.EnableNetworkIsolation is not set to true.

Identifier: SAGEMAKER_MODEL_EXPLAINABILITY_JOB_NETWORK_ISOLATION

Resource Types: AWS::SageMaker::ModelExplainabilityJobDefinition

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Osaka), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-model-in-vpc

Checks if an Amazon SageMaker model uses an Amazon Virtual Private Cloud (Amazon VPC) for container traffic. The rule is NON_COMPLIANT if configuration.VpcConfig does not exist.

Identifier: SAGEMAKER_MODEL_IN_VPC

Resource Types: AWS::SageMaker::Model

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-model-isolation-enabled

Checks if an Amazon SageMaker model has network isolation enabled. The rule is NON_COMPLIANT if configuration.EnableNetworkIsolation is false.

Identifier: SAGEMAKER_MODEL_ISOLATION_ENABLED

Resource Types: AWS::SageMaker::Model

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-model-multicontainer-private-registry

This rule checks if SageMaker models with multi-container inference pipelines pull images from VPC-based private registry. The rule is NON_COMPLIANT if any container configuration does not have ImageConfig or has RepositoryAccessMode set to Platform.

Identifier: SAGEMAKER_MODEL_MULTICONTAINER_PRIVATE_REGISTRY

Resource Types: AWS::SageMaker::Model

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Middle East (Bahrain), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-model-private-registry-required

Checks if Amazon SageMaker models that use a PrimaryContainer pull container image from a private Docker registry in a VPC. The rule is NON_COMPLIANT if ImageConfig is missing or RepositoryAccessMode is set to Platform.

Identifier: SAGEMAKER_MODEL_PRIVATE_REGISTRY_REQUIRED

Resource Types: AWS::SageMaker::Model

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Africa (Cape Town), Europe (Ireland), South America (Sao Paulo), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Europe (Milan), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-model-quality-job-definition-isolation

Checks if Amazon SageMaker model quality job definitions have network isolation enabled. The rule is NON_COMPLIANT if configuration.NetworkConfig.EnableNetworkIsolation is false.

Identifier: SAGEMAKER_MODEL_QUALITY_JOB_DEFINITION_ISOLATION

Resource Types: AWS::SageMaker::ModelQualityJobDefinition

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Osaka), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-model-quality-job-encrypt-in-transit

Checks if Amazon SageMaker model quality job definitions have inter-container traffic encryption enabled when the instance count is 2 or greater. The rule is NON_COMPLIANT if configuration.NetworkConfig.EnableInterContainerTrafficEncryption is false.

Identifier: SAGEMAKER_MODEL_QUALITY_JOB_ENCRYPT_IN_TRANSIT

Resource Types: AWS::SageMaker::ModelQualityJobDefinition

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Middle East (Bahrain), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Osaka), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-monitoring-schedule-isolation

Checks if Amazon SageMaker monitoring schedules have network isolation enabled. The rule is NON_COMPLIANT if configuration.MonitoringScheduleConfig.MonitoringJobDefinition.NetworkConfig.EnableNetworkIsolation is false.

Identifier: SAGEMAKER_MONITORING_SCHEDULE_ISOLATION

Resource Types: AWS::SageMaker::MonitoringSchedule

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), Middle East (Bahrain), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Osaka), Europe (London), Asia Pacific (Tokyo), US West (Oregon), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-monitoring-schedule-traffic-encryption

Checks if SageMaker monitoring schedules have inter-container traffic encryption enabled. The rule is NON_COMPLIANT if MonitoringJobDefinition exists and does not have NetworkConfig defined, or EnableInterContainerTrafficEncryption is not set to true.

Identifier: SAGEMAKER_MONITORING_SCHEDULE_TRAFFIC_ENCRYPTION

Resource Types: AWS::SageMaker::MonitoringSchedule

Trigger type: Configuration changes

AWS Region: Only available in Europe (Stockholm), China (Beijing), Asia Pacific (Mumbai), Europe (Paris), US East (Ohio), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), Asia Pacific (Hong Kong), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Osaka), Europe (London), Asia Pacific (Tokyo), US West (N. California), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-notebook-instance-inside-vpc

Checks if an Amazon SageMaker notebook instance is launched within a VPC or within a list of approved subnets. The rule is NON_COMPLIANT if a notebook instance is not launched within a VPC or if its subnet ID is not included in the parameter list.

Identifier: SAGEMAKER_NOTEBOOK_INSTANCE_INSIDE_VPC

Resource Types: AWS::SageMaker::NotebookInstance

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

SubnetIds (Optional), Type: CSV

Comma-separated list of subnet IDs that notebook instances can be launched in.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-notebook-instance-kms-key-configured

Checks if an AWS Key Management Service (AWS KMS) key is configured for an Amazon SageMaker notebook instance. The rule is NON_COMPLIANT if 'KmsKeyId' is not specified for the SageMaker notebook instance.

Identifier: SAGEMAKER_NOTEBOOK_INSTANCE_KMS_KEY_CONFIGURED

Resource Types: AWS::SageMaker::NotebookInstance

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Asia Pacific (Taipei) Region

Parameters:

kmsKeyArns (Optional), Type: String

Comma-separated list of AWS KMS key ARNs allowed for an Amazon SageMaker notebook instance.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-notebook-instance-platform-version

Checks if a Sagemaker Notebook Instance is configured to use a supported platform identifier version. The rule is NON_COMPLIANT if a Notebook Instance is not using the specified supported platform identifier version as specified in the parameter.

Identifier: SAGEMAKER_NOTEBOOK_INSTANCE_PLATFORM_VERSION

Resource Types: AWS::SageMaker::NotebookInstance

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

supportedPlatformIdentifierVersions, Type: CSV

Comma-separated list of the supported platform identifier version for the rule to check.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-notebook-instance-root-access-check

Checks if the Amazon SageMaker RootAccess setting is enabled for Amazon SageMaker notebook instances. The rule is NON_COMPLIANT if the RootAccess setting is set to ‘Enabled’ for an Amazon SageMaker notebook instance.

Identifier: SAGEMAKER_NOTEBOOK_INSTANCE_ROOT_ACCESS_CHECK

Resource Types: AWS::SageMaker::NotebookInstance

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-notebook-instance-storage-vol-kms-encrypted

Checks whether an Amazon SageMaker notebook instance is configured with a customer managed AWS KMS key for storage volume encryption. The rule is NON_COMPLIANT if KmsKeyId is not set or is empty.

Identifier: SAGEMAKER_NOTEBOOK_INSTANCE_STORAGE_VOL_KMS_ENCRYPTED

Resource Types: AWS::SageMaker::NotebookInstance

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Middle East (Bahrain), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sagemaker-notebook-no-direct-internet-access

Checks if direct internet access is disabled for an Amazon SageMaker notebook instance. The rule is NON_COMPLIANT if a SageMaker notebook instance is internet-enabled.

Identifier: SAGEMAKER_NOTEBOOK_NO_DIRECT_INTERNET_ACCESS

Resource Types: AWS::SageMaker::NotebookInstance

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Asia Pacific (Taipei) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

secretsmanager-rotation-enabled-check

Checks if AWS Secrets Manager secret has rotation enabled. The rule also checks an optional `maximumAllowedRotationFrequency` parameter. If the parameter is specified, the rotation frequency of the secret is compared with the maximum allowed frequency. The rule is NON_COMPLIANT if the secret is not scheduled for rotation. The rule is also NON_COMPLIANT if the rotation frequency is higher than the number specified in the maximumAllowedRotationFrequency parameter.

> **Note**
>
> Re-evaluating this rule within 4 hours of the first evaluation will have no effect on the results.

Identifier: SECRETSMANAGER_ROTATION_ENABLED_CHECK

Resource Types: AWS::SecretsManager::Secret

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

maximumAllowedRotationFrequency (Optional), Type: int

Maximum allowed rotation frequency of the secret in days.

maximumAllowedRotationFrequencyInHours (Optional), Type: int

Maximum allowed rotation frequency of the secret in hours.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

secretsmanager-scheduled-rotation-success-check

Checks if AWS Secrets Manager secrets rotated successfully according to the rotation schedule. Secrets Manager calculates the date the rotation should happen. The rule is NON_COMPLIANT if the date passes and the secret isn't rotated.

> **Note**
>
> **Recording delays**
> Evaluation results for this rule can be delayed for up to 2 days from a missed rotation date. For more immediate monitoring, see Monitor AWS Secrets Manager with Amazon CloudWatch in the *Secrets Manager User Guide*.
>
> **Secrets without rotation**
> The rule returns `NOT_APPLICABLE` for secrets that aren't configured for rotation.

Identifier: SECRETSMANAGER_SCHEDULED_ROTATION_SUCCESS_CHECK

Resource Types: AWS::SecretsManager::Secret

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

secretsmanager-secret-periodic-rotation

Checks if AWS Secrets Manager secrets have been rotated in the past specified number of days. The rule is NON_COMPLIANT if a secret has not been rotated for more than maxDaysSinceRotation number of days. The default value is 90 days.

Identifier: SECRETSMANAGER_SECRET_PERIODIC_ROTATION

Resource Types: AWS::SecretsManager::Secret

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

maxDaysSinceRotation (Optional), Type: int

Maximum number of days in which a secret can remain unchanged. The default value is 90 days.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

secretsmanager-secret-unused

Checks if AWS Secrets Manager secrets have been accessed within a specified number of days. The rule is NON_COMPLIANT if a secret has not been accessed in 'unusedForDays' number of days. The default value is 90 days.

Context: It is recommended to routinely delete unused secrets. Unused secrets can be misused by former users who no longer need access to these secrets. Additionally, as more users gain access to a secret, it becomes increasingly possible that someone has misused a secret or has granted access to an unauthorized entity. Deleting unused secrets helps revoke secret access from users who no longer need it, and can reduce your cost of using AWS Secrets Manager.

Identifier: SECRETSMANAGER_SECRET_UNUSED

Resource Types: AWS::SecretsManager::Secret

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

unusedForDays (Optional), Type: int

The number of days in which a secret can remain unused. The default value is 90 days.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

secretsmanager-using-cmk

Checks if all secrets in AWS Secrets Manager are encrypted using the AWS managed key (`aws/secretsmanager`) or a customer managed key that was created in AWS Key Management Service (AWS KMS). The rule is COMPLIANT if a secret is encrypted using a customer managed key. This rule is NON_COMPLIANT if a secret is encrypted using `aws/secretsmanager`.

> **Note**
>
> This rule does not have access to cross-account customer managed keys and evaluates secrets as NON_COMPLIANT when a cross-account key is used.

Identifier: SECRETSMANAGER_USING_CMK

Resource Types: AWS::SecretsManager::Secret

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

kmsKeyArns (Optional), Type: CSV

Comma-separated list of KMS key Amazon Resource Names (ARNs) to check if the keys are used in the encryption.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

securityhub-enabled

Checks if AWS Security Hub is enabled for an AWS Account. The rule is NON_COMPLIANT if AWS Security Hub is not enabled.

Identifier: SECURITYHUB_ENABLED

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

security-account-information-provided

Checks if you have provided security contact information for your AWS account contacts. The rule is NON_COMPLIANT if security contact information within the account is not provided.

Identifier: SECURITY_ACCOUNT_INFORMATION_PROVIDED

Resource Types: AWS::::Account

Trigger type: Periodic

AWS Region: All supported AWS regions except AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

service-catalog-portfolio-tagged

Checks if AWS Service Catalog portfolio resources have tags. Optionally, required tag keys can be specified. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: SERVICE_CATALOG_PORTFOLIO_TAGGED

Resource Types: AWS::ServiceCatalog::Portfolio

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

service-catalog-shared-within-organization

Checks if AWS Service Catalog shares portfolios to an organization (a collection of AWS accounts treated as a single unit) when integration is enabled with AWS Organizations. The rule is NON_COMPLIANT if the `Type` value of a share is `ACCOUNT`.

Identifier: SERVICE_CATALOG_SHARED_WITHIN_ORGANIZATION

Resource Types: AWS::ServiceCatalog::Portfolio

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

service-vpc-endpoint-enabled

Checks if Service Endpoint for the service provided in rule parameter is created for each Amazon Virtual Private Cloud (Amazon VPC). The rule is NON_COMPLIANT if an Amazon VPC doesn't have an Amazon VPC endpoint created for the service.

Identifier: SERVICE_VPC_ENDPOINT_ENABLED

Resource Types: AWS::EC2::VPC

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

serviceName, Type: String

The short name or suffix for the service. Note: To get a list of available service names or valid suffix list, use DescribeVpcEndpointServices.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ses-malware-scanning-enabled

Checks if malware and spam scanning on receiving messages is enabled for Amazon Simple Email Service (Amazon SES). The rule is NON_COMPLIANT if malware and spam scanning is not enabled.

Identifier: SES_MALWARE_SCANNING_ENABLED

Resource Types: AWS::SES::ReceiptRule

Trigger type: Periodic

AWS Region: Only available in Europe (Ireland), US East (N. Virginia), US West (Oregon) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ses-sending-tls-required

Checks if Amazon Simple Email Service (SES) Configuration Set has TLS encryption enforced for email delivery. The rule is NON_COMPLIANT if the TLS Policy is not set to 'REQUIRE' in the Configuration Set.

Identifier: SES_SENDING_TLS_REQUIRED

Resource Types: AWS::SES::ConfigurationSet

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), AWS GovCloud (US-East), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

shield-advanced-enabled-autorenew

Checks if AWS Shield Advanced is enabled in your AWS account and this subscription is set to automatically renew. The rule is COMPLIANT if Shield Advanced is enabled and auto renew is enabled.

> **Note**
>
> The API endpoint of AWS Shield Advanced is only available in US East (N. Virginia) Region. This rule should only be scheduled to run in the US East (N. Virginia) Region.

Identifier: SHIELD_ADVANCED_ENABLED_AUTORENEW

Trigger type: Periodic

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

shield-drt-access

Checks if the Shield Response Team (SRT) can access your AWS account. The rule is NON_COMPLIANT if AWS Shield Advanced is enabled but the role for SRT access is not configured.

Identifier: SHIELD_DRT_ACCESS

Trigger type: Periodic

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

signer-signingprofile-tagged

Checks if AWS Signer signing profile resources have tags. Optionally, required tag keys can be specified. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: SIGNER_SIGNINGPROFILE_TAGGED

Resource Types: AWS::Signer::SigningProfile

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sns-encrypted-kms

Checks if SNS topics are encrypted with AWS Key Management Service (AWS KMS). The rule is NON_COMPLIANT if an SNS topic is not encrypted with AWS KMS. Optionally, specify the key ARNs, the alias ARNs, the alias name, or the key IDs for the rule to check.

Identifier: SNS_ENCRYPTED_KMS

Resource Types: AWS::SNS::Topic

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

kmsKeyIds (Optional), Type: CSV

> Comma-separated list of AWS KMS key Amazon Resource Names (ARNs), KMS alias ARNs, KMS alias names, or KMS key IDs for the rule to check.

Proactive Evaluation

For steps on how to run this rule in proactive mode, see Evaluating Your Resources with AWS Config Rules. For this rule to return COMPLIANT in proactive mode, the resource configuration schema for the StartResourceEvaluation API needs to include the following inputs, encoded as a string:

```
"ResourceConfiguration":
...
{
   "KmsMasterKeyId": "my-kms-key-Id"
}
...
```

For more information on proactive evaluation, see Evaluation Mode.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sns-topic-message-delivery-notification-enabled

Checks if an Amazon SNS topic has IAM roles for both successful and failed deliveries set for any endpoint type. The rule is NON_COMPLIANT otherwise, including email/SMS-only topics. The rule does not check subscriptions, role existence, or log delivery.

Identifier: SNS_TOPIC_MESSAGE_DELIVERY_NOTIFICATION_ENABLED

Resource Types: AWS::SNS::Topic

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sns-topic-no-public-access

Checks if the SNS topic access policy allows public access. The rule is NON_COMPLIANT if the SNS topic access policy allows public access.

> **Note**
>
> To be considered non-public, an SNS policy must grant access only to fixed values. This means values that don't contain a wildcard or the following IAM policy element: Variables.

Identifier: SNS_TOPIC_NO_PUBLIC_ACCESS

Resource Types: AWS::SNS::Topic

Trigger type: Configuration changes

AWS Region: All supported AWS regions except AWS GovCloud (US-East), AWS GovCloud (US-West), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sqs-queue-dlq-check

Checks if Amazon Simple Queue Service (Amazon SQS) queues have configuration to use dead-letter queue (DLQ). The rule is NON_COMPLIANT if an Amazon SQS queue does not have any configuration to use DLQ.

Identifier: SQS_QUEUE_DLQ_CHECK

Resource Types: AWS::SQS::Queue

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sqs-queue-no-public-access

Checks if the SQS queue access policy allows public access. The rule is NON_COMPLIANT if the SQS queue access policy allows public access.

> **Note**
>
> To be considered non-public, an SQS policy must grant access only to fixed values. This means values that don't contain a wildcard or the following IAM policy element: Variables.

Identifier: SQS_QUEUE_NO_PUBLIC_ACCESS

Resource Types: AWS::SQS::Queue

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

sqs-queue-policy-full-access-check

Checks if the SQS queue access policy allows full access. The rule is NON_COMPLIANT if the SQS policy contains `SQS:*` within `Action` and `Effect` is `Allow`.

Identifier: SQS_QUEUE_POLICY_FULL_ACCESS_CHECK

Resource Types: AWS::SQS::Queue

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ssm-automation-block-public-sharing

Checks if AWS Systems Manager Documents has block public sharing enabled. The rule is NON_COMPLIANT if Systems Manager Documents has block public sharing disabled.

Identifier: SSM_AUTOMATION_BLOCK_PUBLIC_SHARING

Resource Types: AWS::::Account

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (Melbourne) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ssm-automation-logging-enabled

Checks if AWS Systems Manager Automation has Amazon CloudWatch logging enabled. The rule returns NON_COMPLIANT if Systems Manager Automation doesn't have CloudWatch logging enabled.

Identifier: SSM_AUTOMATION_LOGGING_ENABLED

Resource Types: AWS::::Account

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ssm-document-not-public

Checks if AWS Systems Manager documents owned by the account are public. The rule is NON_COMPLIANT if Systems Manager documents with the owner 'Self' are public.

Identifier: SSM_DOCUMENT_NOT_PUBLIC

Resource Types: AWS::SSM::Document

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

ssm-document-tagged

Checks if AWS Systems Manager documents have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: SSM_DOCUMENT_TAGGED

Resource Types: AWS::SSM::Document

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

stepfunctions-state-machine-tagged

Checks if AWS Step Functions state machines have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: STEPFUNCTIONS_STATE_MACHINE_TAGGED

Resource Types: AWS::StepFunctions::StateMachine

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

step-functions-state-machine-logging-enabled

Checks if AWS Step Functions machine has logging enabled. The rule is NON_COMPLIANT if a state machine does not have logging enabled or the logging configuration is not at the minimum level provided.

Identifier: STEP_FUNCTIONS_STATE_MACHINE_LOGGING_ENABLED

Resource Types: AWS::StepFunctions::StateMachine

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Canada West (Calgary) Region

Parameters:

cloudWatchLogGroupArns (Optional), Type: CSV

Comma-separated list of Amazon Resource Names (ARNs) for Amazon CloudWatch Logs log groups. The rule checks if the specified log groups are configured for your state machine logs.

logLevel (Optional), Type: String

The minimum log level for your state machine. Valid values include: ALL, ERROR, FATAL.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

storagegateway-last-backup-recovery-point-created

Checks if a recovery point was created for AWS Storage Gateway volumes. The rule is NON_COMPLIANT if the Storage Gateway volume does not have a corresponding recovery point created within the specified time period.

Identifier: STORAGEGATEWAY_LAST_BACKUP_RECOVERY_POINT_CREATED

Resource Types: AWS::StorageGateway::Volume

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

recoveryPointAgeUnit (Optional), Type: String, Default: days

Unit of time for maximum allowed age. Accepted values: 'hours', 'days'.

recoveryPointAgeValue (Optional), Type: int, Default: 1

Numerical value for maximum allowed age. No more than 744 for hours, 31 for days.

resourceId (Optional), Type: String

ID of Storage Gateway volume for the rule to check.

resourceTags (Optional), Type: String

Tags of Storage Gateway volumes for the rule to check, in JSON format `{"tagkey" : "tagValue"}`.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

storagegateway-resources-in-logically-air-gapped-vault

Checks if AWS Storage Gateway volumes are in a logically air-gapped vault. The rule is NON_COMPLIANT if an AWS Storage Gateway volume is not in a logically air-gapped vault within the specified time period.

Identifier: STORAGEGATEWAY_RESOURCES_IN_LOGICALLY_AIR_GAPPED_VAULT

Resource Types: AWS::StorageGateway::Volume

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

recoveryPointAgeUnit (Optional), Type: String, Default: days

Unit of time for maximum allowed age. Accepted values: 'hours', 'days'.

recoveryPointAgeValue (Optional), Type: int, Default: 1

Numerical value for maximum allowed age. No more than 2184 for hours, 91 for days.

resourceId (Optional), Type: String

ID of Storage Gateway volume for the rule to check.

resourceTags (Optional), Type: String

Tags of Storage Gateway volumes for the rule to check, in JSON format.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

storagegateway-resources-protected-by-backup-plan

Checks if AWS Storage Gateway volumes are protected by a backup plan. The rule is NON_COMPLIANT if the Storage Gateway volume is not covered by a backup plan.

Identifier: STORAGEGATEWAY_RESOURCES_PROTECTED_BY_BACKUP_PLAN

Resource Types: AWS::StorageGateway::Volume

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), China (Ningxia) Region

Parameters:

backupVaultLockCheck (Optional), Type: String

Accepted values: 'True' or 'False'. Enter 'True' for the rule to check if the resource is backed up in a locked vault

crossAccountList (Optional), Type: String

Comma-separated list of destination accounts for cross-account backup copy to be kept

crossRegionList (Optional), Type: String

Comma-separated list of destination regions for the cross-region backup copy to be kept

maxRetentionDays (Optional), Type: int

The maximum retention period in days for the Backup Vault Lock

minRetentionDays (Optional), Type: int

The minimum retention period in days for the Backup Vault Lock

resourceId (Optional), Type: String

ID of Storage Gateway volume for the rule to check.

resourceTags (Optional), Type: String

Tags for Storage Gateway Volumes for the rule to check, in JSON format.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

subnet-auto-assign-public-ip-disabled

Checks if Amazon Virtual Private Cloud (Amazon VPC) subnets are configured to automatically assign public IP addresses to instances launched within them. This rule is COMPLIANT if subnets do not auto-assign public IPv4 or IPv6 addresses. This rule is NON_COMPLIANT if subnets auto-assign public IPv4 or IPv6 addresses.

> **Warning**
>
> This rule does not distinguish between private and public Global Unicast Address (GUA) IPv6 ranges and will treat all GUA ranges as violations when auto-assignment is enabled.

Identifier: SUBNET_AUTO_ASSIGN_PUBLIC_IP_DISABLED

Resource Types: AWS::EC2::Subnet

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

Proactive Evaluation

For steps on how to run this rule in proactive mode, see Evaluating Your Resources with AWS Config Rules. For this rule to return COMPLIANT in proactive mode, the resource configuration schema for the StartResourceEvaluation API needs to include the following inputs, encoded as a string:

```
"ResourceConfiguration":
...
{
   "MapPublicIpOnLaunch": BOOLEAN
}
...
```

For more information on proactive evaluation, see Evaluation Mode.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

transfer-agreement-description

Checks if AWS Transfer Family agreements have a description. The rule is NON_COMPLIANT if configuration.Description does not exist.

Identifier: TRANSFER_AGREEMENT_DESCRIPTION

Resource Types: AWS::Transfer::Agreement

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

transfer-agreement-tagged

Checks if AWS Transfer Family agreements have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: TRANSFER_AGREEMENT_TAGGED

Resource Types: AWS::Transfer::Agreement

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

transfer-certificate-description

Checks if AWS Transfer Family certificates have a description. The rule is NON_COMPLIANT if configuration.Description does not exist.

Identifier: TRANSFER_CERTIFICATE_DESCRIPTION

Resource Types: AWS::Transfer::Certificate

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

transfer-certificate-tagged

Checks if AWS Transfer Family certificates have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: TRANSFER_CERTIFICATE_TAGGED

Resource Types: AWS::Transfer::Certificate

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

transfer-connector-as2-encryption-algorithm-check

Checks that AWS Transfer Family AS2 connectors are not configured with a weak encryption algorithm. The rule is NON_COMPLIANT if configuration.As2Config.EncryptionAlgorithm is 'DES_EDE3_CBC'.

Identifier: TRANSFER_CONNECTOR_AS2_ENCRYPTION_ALGORITHM_CHECK

Resource Types: AWS::Transfer::Connector

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

approvedEncryptionAlgorithms (Optional), Type: CSV

Comma-separated list of approved encryption algorithms for the rule to check. If provided, the rule is NON_COMPLIANT if configuration.As2Config.EncryptionAlgorithm is configured with a value not specified in this parameter. Valid values include: 'AES128_CBC', 'AES192_CBC', 'AES256_CBC', 'NONE', and 'DES_EDE3_CBC'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

transfer-connector-as2-mdn-signing-algorithm-check

Checks if AWS Transfer Family AS2 connectors are configured with a specified MDN signing algorithm for MDN responses. The rule is NON_COMPLIANT if configuration.As2Config.MdnSigningAlgorithm is a value not specified in the required rule parameter.

Identifier: TRANSFER_CONNECTOR_AS2_MDN_SIGNING_ALGORITHM_CHECK

Resource Types: AWS::Transfer::Connector

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

approvedMdnSigningAlgorithms, Type: CSV

> Comma-separated list of approved MDN signing algorithms for the rule to check. The rule is NON_COMPLIANT if configuration.As2Config.MdnSigningAlgorithm is configured with a value not specified in this parameter. Valid values include: 'SHA256', 'SHA384', 'SHA512', 'SHA1', 'DEFAULT', and 'NONE'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

transfer-connector-as2-signing-algorithm-check

Checks if AWS Transfer Family AS2 connectors are configured with a signing algorithm. The rule is NON_COMPLIANT if configuration.As2Config.SigningAlgorithm is 'NONE'.

Identifier: TRANSFER_CONNECTOR_AS2_SIGNING_ALGORITHM_CHECK

Resource Types: AWS::Transfer::Connector

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

approvedSigningAlgorithms (Optional), Type: CSV

> Comma-separated list of approved signing algorithms for the rule to check. If provided, the rule is NON_COMPLIANT if configuration.As2Config.SigningAlgorithm is configured with a value not specified in this parameter. Valid values include: 'SHA256', 'SHA384', 'SHA512', 'SHA1', and 'NONE'.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

transfer-connector-logging-enabled

Checks if AWS Transfer Family Connector publishes logs to Amazon CloudWatch. The rule is NON_COMPLIANT if a Connector does not have a LoggingRole assigned.

Identifier: TRANSFER_CONNECTOR_LOGGING_ENABLED

Resource Types: AWS::Transfer::Connector

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

transfer-connector-tagged

Checks if AWS Transfer Family connectors have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: TRANSFER_CONNECTOR_TAGGED

Resource Types: AWS::Transfer::Connector

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

transfer-family-server-no-ftp

Checks if a server created with AWS Transfer Family uses FTP for endpoint connection. The rule is NON_COMPLIANT if the server protocol for endpoint connection is FTP-enabled.

Identifier: TRANSFER_FAMILY_SERVER_NO_FTP

Resource Types: AWS::Transfer::Server

Trigger type: Periodic

AWS Region: All supported AWS regions except China (Beijing), Canada West (Calgary), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

transfer-profile-tagged

Checks if AWS Transfer Family profiles have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: TRANSFER_PROFILE_TAGGED

Resource Types: AWS::Transfer::Profile

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

transfer-workflow-description

Checks if AWS Transfer Family workflows have a description. The rule is NON_COMPLIANT if configuration.Description does not exist or is an empty string.

Identifier: TRANSFER_WORKFLOW_DESCRIPTION

Resource Types: AWS::Transfer::Workflow

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

transfer-workflow-tagged

Checks if AWS Transfer Family workflows have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: TRANSFER_WORKFLOW_TAGGED

Resource Types: AWS::Transfer::Workflow

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), China (Ningxia) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

virtualmachine-last-backup-recovery-point-created

Checks if a recovery point was created for AWS Backup-Gateway VirtualMachines. The rule is NON_COMPLIANT if an AWS Backup-Gateway VirtualMachines does not have a corresponding recovery point created within the specified time period.

Identifier: VIRTUALMACHINE_LAST_BACKUP_RECOVERY_POINT_CREATED

Resource Types: AWS::BackupGateway::VirtualMachine

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

recoveryPointAgeUnit (Optional), Type: String, Default: days

Unit of time for maximum allowed age. Accepted values: 'hours', 'days'.

recoveryPointAgeValue (Optional), Type: int, Default: 1

Numerical value for maximum allowed age. No more than 744 for hours, 31 for days.

resourceId (Optional), Type: String

ID of AWS Backup-Gateway VirtualMachine for the rule to check.

resourceTags (Optional), Type: String

Tags of AWS Backup-Gateway VirtualMachines for the rule to check, in JSON format `{"tagkey" : "tagValue"}`.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

virtualmachine-resources-in-logically-air-gapped-vault

Checks if AWS Backup-Gateway VirtualMachines are in a logically air-gapped vault. The rule is NON_COMPLIANT if an AWS Backup-Gateway VirtualMachines is not in a logically air-gapped vault within the specified time period.

Identifier: VIRTUALMACHINE_RESOURCES_IN_LOGICALLY_AIR_GAPPED_VAULT

Resource Types: AWS::BackupGateway::VirtualMachine

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

recoveryPointAgeUnit (Optional), Type: String, Default: days

Unit of time for maximum allowed age. Accepted values: 'hours', 'days'.

recoveryPointAgeValue (Optional), Type: int, Default: 1

Numerical value for maximum allowed age. No more than 2184 for hours, 91 for days.

resourceId (Optional), Type: String

ID of AWS Backup-Gateway VirtualMachine for the rule to check.

resourceTags (Optional), Type: String

Tags of AWS Backup-Gateway VirtualMachines for the rule to check, in JSON format.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

virtualmachine-resources-protected-by-backup-plan

Checks if AWS Backup-Gateway VirtualMachines are protected by a backup plan. The rule is NON_COMPLIANT if the Backup-Gateway VirtualMachine is not covered by a backup plan.

Identifier: VIRTUALMACHINE_RESOURCES_PROTECTED_BY_BACKUP_PLAN

Resource Types: AWS::BackupGateway::VirtualMachine

Trigger type: Periodic

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

backupVaultLockCheck (Optional), Type: String

Accepted values: 'True' or 'False'. Enter 'True' for the rule to check if the resource is backed up in a locked vault

crossAccountList (Optional), Type: String

Comma-separated list of destination accounts for cross-account backup copy to be kept

crossRegionList (Optional), Type: String

Comma-separated list of destination regions for the cross-region backup copy to be kept

maxRetentionDays (Optional), Type: int

The maximum retention period in days for the Backup Vault Lock

minRetentionDays (Optional), Type: int

The minimum retention period in days for the Backup Vault Lock

resourceId (Optional), Type: String

ID of AWS Backup-Gateway VirtualMachine for the rule to check.

resourceTags (Optional), Type: String

Tags for AWS Backup-Gateway VirtualMachines for the rule to check, in JSON format `{"tagkey" : "tagValue"}`.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

vpc-default-security-group-closed

Checks if the default security group of any Amazon Virtual Private Cloud (Amazon VPC) does not allow inbound or outbound traffic. The rule is NON_COMPLIANT if the default security group has one or more inbound or outbound traffic rules.

> **Note**
>
> There may be a delay between when AWS Config records the deletion of related resources such as default security groups, which are deleted as part of the Amazon VPC deletion. As a result, even if all default security groups or other related resources have been deleted or remediated, the rule may report NON_COMPLIANT until the next account baselining process.

Identifier: VPC_DEFAULT_SECURITY_GROUP_CLOSED

Resource Types: AWS::EC2::SecurityGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

vpc-endpoint-enabled

Checks if each service specified in the parameter has an Amazon VPC endpoint. The rule is NON_COMPLIANT if Amazon VPC does not have a VPC endpoint created for each specified service. Optionally, you can specify certain VPCs for the rule to check.

Identifier: VPC_ENDPOINT_ENABLED

Resource Types: AWS::EC2::VPC

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

serviceNames, Type: CSV

Comma-separated list of service names or endpoints. Example: "ec2, ecr.api" or "com.amazonaws.region.ec2". Use DescribeVpcEndpointServices for available names. The rule considers FIPS version of the endpoint to be compliant as well.

scopeConfigResourceTypes (Optional), Type: CSV

Comma-separated list of AWS Config resource types for the rule to check. If specified, the rule returns a compliance status only if at least one specified resource is recorded in the account. For example: "AWS::SNS::Topic".

vpcIds (Optional), Type: CSV

Comma-separated list of Amazon VPC IDs for VPC endpoints. If provided, the rule is NON_COMPLIANT if the services specified in the serviceName parameter do not have one of these VPC endpoints.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

vpc-flow-logs-enabled

Checks if Amazon Virtual Private Cloud (Amazon VPC) flow logs are found and enabled for all Amazon VPCs. The rule is NON_COMPLIANT if flow logs are not enabled for at least one Amazon VPC.

Identifier: VPC_FLOW_LOGS_ENABLED

Resource Types: AWS::EC2::VPC

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

trafficType (Optional), Type: String

TrafficType of flow logs

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

vpc-network-acl-unused-check

Checks if there are unused network access control lists (network ACLs). The rule is COMPLIANT if each network ACL is associated with a subnet. The rule is NON_COMPLIANT if a network ACL is not associated with a subnet.

Identifier: VPC_NETWORK_ACL_UNUSED_CHECK

Resource Types: AWS::EC2::NetworkAcl

Trigger type: Configuration changes

AWS Region: All supported AWS regions

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

vpc-peering-dns-resolution-check

Checks if DNS resolution from accepter/requester VPC to private IP is enabled. The rule is NON_COMPLIANT if DNS resolution from accepter/requester VPC to private IP is not enabled.

Identifier: VPC_PEERING_DNS_RESOLUTION_CHECK

Resource Types: AWS::EC2::VPCPeeringConnection

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

vpcIds (Optional), Type: CSV

Comma-separated list of VPC IDs to be checked.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

vpc-sg-open-only-to-authorized-ports

Checks if security groups allowing unrestricted incoming traffic ('0.0.0.0/0' or '::/0') only allow inbound TCP or UDP connections on authorized ports. The rule is NON_COMPLIANT if such security groups do not have ports specified in the rule parameters.

> **Note**
>
> This rule evaluates Amazon EC2 security groups with ingress rule set to IPv4='0.0.0.0/0' or IPv6='::/'. If the security group does not have one of those destinations, this rule returns `NOT_APPLICABLE`.

Identifier: VPC_SG_OPEN_ONLY_TO_AUTHORIZED_PORTS

Resource Types: AWS::EC2::SecurityGroup

Trigger type: Configuration changes and Periodic

AWS Region: All supported AWS regions

Parameters:

authorizedTcpPorts (Optional), Type: String

Comma-separated list of TCP ports authorized to be open to 0.0.0.0/0 or ::/0. Ranges are defined by dash, for example, "443,1020-1025".

authorizedUdpPorts (Optional), Type: String

Comma-separated list of UDP ports authorized to be open to 0.0.0.0/0 or ::/0. Ranges are defined by dash, for example, "500,1020-1025".

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

vpc-sg-port-restriction-check

Checks if security groups restrict incoming traffic to restricted ports explicitly from 0.0.0.0/0 or ::/0. The rule is NON_COMPLIANT if security groups allow incoming traffic from 0.0.0.0/0 or ::/0 over TCP/UDP ports 22/3389 or as specified in parameters.

Identifier: VPC_SG_PORT_RESTRICTION_CHECK

Resource Types: AWS::EC2::SecurityGroup

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

excludeExternalSecurityGroups (Optional), Type: boolean

Boolean flag to exclude the evaluation of external security groups. If set to 'true', the rule will not include external security groups in the evaluation. Otherwise, all security groups are evaluated if value is set to 'false.' Default value is 'true'.

ipType (Optional), Type: String

The Internet Protocol (IP) version for the rule to check. Valid values include 'IPv4', 'IPv6', and 'ALL' (case-insensitive). If not specified, the rule defaults to check for 'ALL'.

protocolType (Optional), Type: String

The Transmission Protocol Type for the rule to check. Valid values include 'TCP', 'UDP', and 'ALL' (case-insensitive). If set to 'ALL', the rule will check for rules that use either 'TCP', 'UDP', or 'ALL' (-1) protocol. Default value is 'ALL'.

restrictPorts (Optional), Type: CSV

Comma-separated list of ports that should not be open for incoming traffic over the full IP range. Valid port numbers range from 0 to 65535. If not specified, the rule defaults to check for 22 and 3389.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

vpc-vpn-2-tunnels-up

Checks if both virtual private network (VPN) tunnels provided by AWS Site-to-Site VPN are in UP status. The rule is NON_COMPLIANT if one or both tunnels are in DOWN status.

> **Note**
>
> Tunnel state transitions may take up to 24 hours to be detected.

Identifier: VPC_VPN_2_TUNNELS_UP

Resource Types: AWS::EC2::VPNConnection

Trigger type: Configuration changes

AWS Region: All supported AWS regions except China (Beijing), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

wafv2-logging-enabled

Checks if logging is enabled on AWS WAFv2 regional and global web access control lists (web ACLs). The rule is NON_COMPLIANT if the logging is enabled but the logging destination does not match the value of the parameter.

> **Note**
>
> **Amazon Security Lake Exception**
> This rule does not check logging done with Security Lake for AWS WAFV2 web ACLs.

Identifier: WAFV2_LOGGING_ENABLED

Resource Types: AWS::WAFv2::WebACL

Trigger type: Periodic

AWS Region: All supported AWS regions

Parameters:

KinesisFirehoseDeliveryStreamArns (Optional), Type: CSV

Comma separated list of Kinesis Firehose delivery stream ARNs

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

wafv2-rulegroup-logging-enabled

Checks if Amazon CloudWatch security metrics collection on AWS WAFv2 rule groups is enabled. The rule is NON_COMPLIANT if the 'VisibilityConfig.CloudWatchMetricsEnabled' field is set to false.

Context: AWS WAFV2 (Web Application Firewall version 2) allows you to create AWS WAF rules to protect your web applications from common web exploits and vulnerabilities. An AWS WAF rule group is a collection of AWS WAF rules that you can associate with a web ACL (Access Control List) to define the desired behavior for your web application traffic. For more information, see AWS WAF rules and Rule groups in the *AWS WAF Developer Guide*.

By configuring CloudWatch security metrics collection on AWS WAFV2 rules group, you can monitor security metrics such as successful or failed Distributed denial of service (DDoS), SQL injection, and Cross-site scripting (XSS) attacks. The security metrics collected can help you simplify your investigations.

> **Note**
>
> If there are no AWS WAF rules in the AWS WAFV2 rule group for the AWS Config managed rule to check, the AWS Config managed rule returns `NOT_APPLICABLE`.

Identifier: WAFV2_RULEGROUP_LOGGING_ENABLED

Resource Types: AWS::WAFv2::RuleGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except AWS GovCloud (US-East), AWS GovCloud (US-West) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

wafv2-rulegroup-not-empty

Checks if WAFv2 Rule Groups contain rules. The rule is NON_COMPLIANT if there are no rules in a WAFv2 Rule Group.

Identifier: WAFV2_RULEGROUP_NOT_EMPTY

Resource Types: AWS::WAFv2::RuleGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

wafv2-webacl-not-empty

Checks if a WAFv2 Web ACL contains any WAF rules or WAF rule groups. This rule is NON_COMPLIANT if a Web ACL does not contain any WAF rules or WAF rule groups.

Identifier: WAFV2_WEBACL_NOT_EMPTY

Resource Types: AWS::WAFv2::WebACL

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (Thailand), Middle East (UAE), Asia Pacific (Hyderabad), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

waf-classic-logging-enabled

Checks if logging is enabled on AWS WAF classic global web access control lists (web ACLs). The rule is NON_COMPLIANT for a global web ACL, if it does not have logging enabled.

Identifier: WAF_CLASSIC_LOGGING_ENABLED

Resource Types: AWS::WAF::WebACL

Trigger type: Periodic

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

KinesisFirehoseDeliveryStreamArns (Optional), Type: CSV

Comma separated list of Amazon Kinesis stream ARN for AWS WAF logs.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

waf-global-rulegroup-not-empty

Checks if an AWS WAF Classic rule group contains any rules. The rule is NON_COMPLIANT if there are no rules present within a rule group.

Identifier: WAF_GLOBAL_RULEGROUP_NOT_EMPTY

Resource Types: AWS::WAF::RuleGroup

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

waf-global-rule-not-empty

Checks if an AWS WAF global rule contains any conditions. The rule is NON_COMPLIANT if no conditions are present within the WAF global rule.

Identifier: WAF_GLOBAL_RULE_NOT_EMPTY

Resource Types: AWS::WAF::Rule

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

waf-global-webacl-not-empty

Checks whether a WAF Global Web ACL contains any WAF rules or rule groups. This rule is NON_COMPLIANT if a Web ACL does not contain any WAF rule or rule group.

Identifier: WAF_GLOBAL_WEBACL_NOT_EMPTY

Resource Types: AWS::WAF::WebACL

Trigger type: Configuration changes

AWS Region: Only available in US East (N. Virginia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

waf-regional-rulegroup-not-empty

Checks if WAF Regional rule groups contain any rules. The rule is NON_COMPLIANT if there are no rules present within a WAF Regional rule group.

Identifier: WAF_REGIONAL_RULEGROUP_NOT_EMPTY

Resource Types: AWS::WAFRegional::RuleGroup

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), China (Beijing), Asia Pacific (Thailand), Asia Pacific (Jakarta), Middle East (UAE), Asia Pacific (Hyderabad), Asia Pacific (Osaka), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico

(Central), Israel (Tel Aviv), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), China (Ningxia), Europe (Zurich) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

waf-regional-rule-not-empty

Checks whether WAF regional rule contains conditions. This rule is COMPLIANT if the regional rule contains at least one condition and NON_COMPLIANT otherwise.

Identifier: WAF_REGIONAL_RULE_NOT_EMPTY

Resource Types: AWS::WAFRegional::Rule

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

waf-regional-webacl-not-empty

Checks if a WAF regional Web ACL contains any WAF rules or rule groups. The rule is NON_COMPLIANT if there are no WAF rules or rule groups present within a Web ACL.

Identifier: WAF_REGIONAL_WEBACL_NOT_EMPTY

Resource Types: AWS::WAFRegional::WebACL

Trigger type: Configuration changes

AWS Region: All supported AWS regions except Asia Pacific (New Zealand), Asia Pacific (Thailand), Asia Pacific (Malaysia), AWS GovCloud (US-East), AWS GovCloud (US-West), Mexico (Central), Asia Pacific (Taipei), Canada West (Calgary) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

workspaces-connection-alias-tagged

Checks if Amazon WorkSpaces connection aliases have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: WORKSPACES_CONNECTION_ALIAS_TAGGED

Resource Types: AWS::WorkSpaces::ConnectionAlias

Trigger type: Configuration changes

AWS Region: Only available in Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

workspaces-root-volume-encryption-enabled

Checks if an Amazon WorkSpace volume has the root volume encryption settings set to enabled. This rule is NON_COMPLIANT if the encryption setting is not enabled for the root volume.

Identifier: WORKSPACES_ROOT_VOLUME_ENCRYPTION_ENABLED

Resource Types: AWS::WorkSpaces::Workspace

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Africa (Cape Town), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Malaysia), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

workspaces-user-volume-encryption-enabled

Checks if an Amazon WorkSpace volume has the user volume encryption settings set to enabled. This rule is NON_COMPLIANT if the encryption setting is not enabled for the user volume.

Identifier: WORKSPACES_USER_VOLUME_ENCRYPTION_ENABLED

Resource Types: AWS::WorkSpaces::Workspace

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Africa (Cape Town), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Malaysia), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central), China (Ningxia) Region

Parameters:

None

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

workspaces-workspace-tagged

Checks if Amazon WorkSpaces workspaces have tags. Optionally, you can specify tag keys. The rule is NON_COMPLIANT if there are no tags or if the specified tag keys are not present. The rule does not check for tags starting with 'aws:'.

Identifier: WORKSPACES_WORKSPACE_TAGGED

Resource Types: AWS::WorkSpaces::Workspace

Trigger type: Configuration changes

AWS Region: Only available in Asia Pacific (Mumbai), Africa (Cape Town), Europe (Ireland), Europe (Frankfurt), South America (Sao Paulo), US East (N. Virginia), Asia Pacific (Seoul), Europe (London), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central) Region

Parameters:

requiredKeyTags (Optional), Type: CSV

> Comma-separated list of tag keys for the rule to check. If provided, the rule is NON_COMPLIANT if the evaluated resource does not contain these keys. Tag keys are case-sensitive. Tag keys starting with 'aws:' are not allowed.

AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.

List of AWS Config Managed Rules by Evaluation Mode

AWS Config currently supports the following managed rules. Before using these rules, see Considerations.

Proactive Evaluation

Proactive rules are rules that support the proactive evaluation mode for resources that have not been deployed. This allows you to evaluate whether a set of resource properties, if used to define an AWS resource, would be COMPLIANT or NON_COMPLIANT given the set of proactive rules that you have in your account in your Region. For more information, see Evaluation modes.

> **Note**
>
> Proactive rules do not remediate resources that are flagged as NON_COMPLIANT or prevent them from being deployed.

Proactive Evaluation

- subnet-auto-assign-public-ip-disabled

Detective Evaluation

Detective rules are rules that support the detective evaluation mode for resource that have already been deployed. This allows you to evaluate the configuration settings of your existing resources.

> **Note**
>
> Currently, all AWS Config rules support detective evaluation.

List of AWS Config Managed Rules by Trigger Type

AWS Config currently supports the following managed rules. Before using these rules, see Considerations.

Configuration Changes

Change-triggered rules are rules that AWS Config evaluates in response to configuration changes.

Periodic

Periodic rules are rules that AWS Config evaluates periodicially at a frequency that you specify; for example, every 24 hours.

Periodic

Hybrid

Hybrid rules are rules that AWS Config evaluates both in response to configuration changes and periodicially.

Hybrid

- acm-certificate-expiration-check
- cloudformation-stack-drift-detection-check
- ec2-instance-launched-with-allowed-ami
- incoming-ssh-disabled
- restricted-incoming-traffic
- s3-bucket-public-read-prohibited
- s3-bucket-public-write-prohibited
- vpc-sg-open-only-to-authorized-ports

List of AWS Config Managed Rules by Region Availability

AWS Config currently supports the following managed rules. Before using these rules, see Considerations.

US East (Ohio) Region

US East (Ohio)
